E E S S I
EUROPEAN ENVIRONMENT FOR
SCIENTIFIC SOFTWARE INSTALLATIONS

From EasyBuild to EESSI

Kenneth Hoste (HPC-UGent)

2022 Swiss Conference & HPCXXL User Group

9 March 2022 - virtual

whoami

- Computer scientist with Masters + PhD from Ghent University
- Joined HPC-UGent team in October 2010
- Main tasks: user support, incl. installation of scientific software
- Inherited maintenance of EasyBuild in 2011
- Slowly also became **EasyBuild lead developer & release manager** ...
- I like beer, loud music, FOSS (Free & Open Source Software), dad jokes
- I don't like CMake, SCons, Bazel, TensorFlow, OpenFOAM, ...

easybuild in a nutshell

easybuild.io

docs.easybuild.io

youtube.com/c/easybuilders

twitter.com/easy_build

easybuild.io/tutorial

easybuild.io/eum

- **Framework to get scientific software installed** (preferably from source)
- Focus on Linux & HPC systems, specific attention to **performance** of installed software
- Implemented in Python, supports both Python 2.7 and 3.5+
- Integrates with environment modules tool (Tcl-based Environment Modules + Lmod)
- **GPLv2 open source license**, available via GitHub and Python Package Index (PyPI)
- Supports different compiler toolchains + over 2,600 software packages (excl. extensions)
- Created by HPC-UGent team, now supported & developed by a **worldwide community...**

Installing TensorFlow from source, with ease

```
$ eb TensorFlow-2.6.0-foss-2021a-CUDA-11.3.1.eb

Online tutorial in June'20
Half-day tutorial @ ISC'21
Half-day tutorial @ ISC'22

High-level feature summary (1/2)

- **Fully autonomously building and installing (scientific) software**
- Automatic generation of environment module files (Tcl or Lua syntax)
- Thorough logging of executed installation procedure
- Archiving of easyconfigs ("build recipes") and patch files
- **Highly configurable**, via configuration files + environment variables + command line
- Actively developed, frequent stable releases (every 6-8 weeks)

High-level feature summary (2/2)

- Support for using a custom module naming scheme (incl. hierarchical)
- **Dynamically extendable** with additional easyblocks, toolchains, etc.
- **Transparency** via support for 'dry run' installation & trace output
- **Customisable** through implementation of hooks (Python functions)
- Extensively tested: unit tests, thorough testing of easyconfig PRs, regression testing
- **Integration with GitHub**, Slurm, FPM, Docker, Singularity, Rich, ...
- **Worldwide collaboration** across HPC sites (JSC, CSCS, Compute Canada, LUMI, ...)

Recent enhancements

- Automatic fallback for downloading source files from <https://sources.easybuild.io>
- **Easystack files** to facilitate managing of entire software stacks *[experimental]*
- **Adoption of FlexiBLAS in common foss toolchain**
- Improved support for RPATH linking ([see docs](#))
- **Integration with Rich:** colorful output, multi-level progress bars, ...
- Support for skipping extensions + **installing extensions in parallel** *[experimental]*
- Initial support for installing ROCm (AMD GPUs), NVHPC-based toolchains, RISC-V, ...

Site customization via hooks

- **EasyBuild behaviour can be customized to adhere to site policies by using hooks**
- Custom `*_hook` Python functions to take action or manipulate internal data structures
- Different types of hooks: start/end hook, parse hook, pre/post-step hooks, ...
- Example: customizing configure options for Open MPI:

```
def pre_configure_hook(self, *args, **kwargs):  
  
    if self.name == 'OpenMPI' and '--with-verbs' in self.cfg['configopts']:  
        self.log.info("[pre-configure hook] Replacing --with-verbs with --without-verbs")  
        self.cfg['configopts'] = self.cfg['configopts'].replace('--with-verbs', '--without-verbs')
```

- Extensively used by some EasyBuild sites (cfr. [EUM'22 talk on heterogeneous MPI stack](#))
- More information: docs.easybuild.io/en/latest/Hooks.html

Easystack files

- **Specifies software stack to install in YAML syntax**, supported since EasyBuild v4.3.2
- Structured by software name, toolchain, software version(s)
- Enhancements to be implemented:
 - Allow specifying easyconfig file names
 - Support for specifying EasyBuild configuration settings
 - Filtering based on "labels" in EasyBuild configuration
 - Support for using regular expressions
- More information: docs.easybuild.io/en/latest/Easystack-files.html
- **Experimental feature** - requires configuring EasyBuild to enable using it - subject to change

```
software: example
  GROMACS:
    toolchains:
      foss-2020a:
        versions: ['2020.3']
      fosscuda-2020a:
        versions: ['2020.3']
  OpenFOAM:
    toolchains:
      foss-2020a:
        versions: ['8', 'v2006']
  R:
    toolchains:
      foss-2020a:
        versions: ['4.0.0']
```

FlexiBLAS in foss toolchain

- Link with FlexiBLAS rather than directly with OpenBLAS, BLIS, MKL, ...
- **Select BLAS/LAPACK "backend" library to use at runtime, no need to re-link!**
- To use BLIS rather than OpenBLAS:

```
module load app/1.2.3-foss-2021b
module load BLIS/0.8.1-GCC-11.2.0
export FLEXIBLAS=BLIS
```

- Performance overhead is essentially non-existent (~20 *clock cycles* per function call)
- Also enables profiling to see which BLAS/LAPACK functions are most used

```
export FLEXIBLAS_HOOK=PROFILE
```

- See [EasyBuild Tech Talk III on FlexiBLAS](#) for more details
- [MPItrampoline](#) seems like a promising equivalent for MPI libraries...

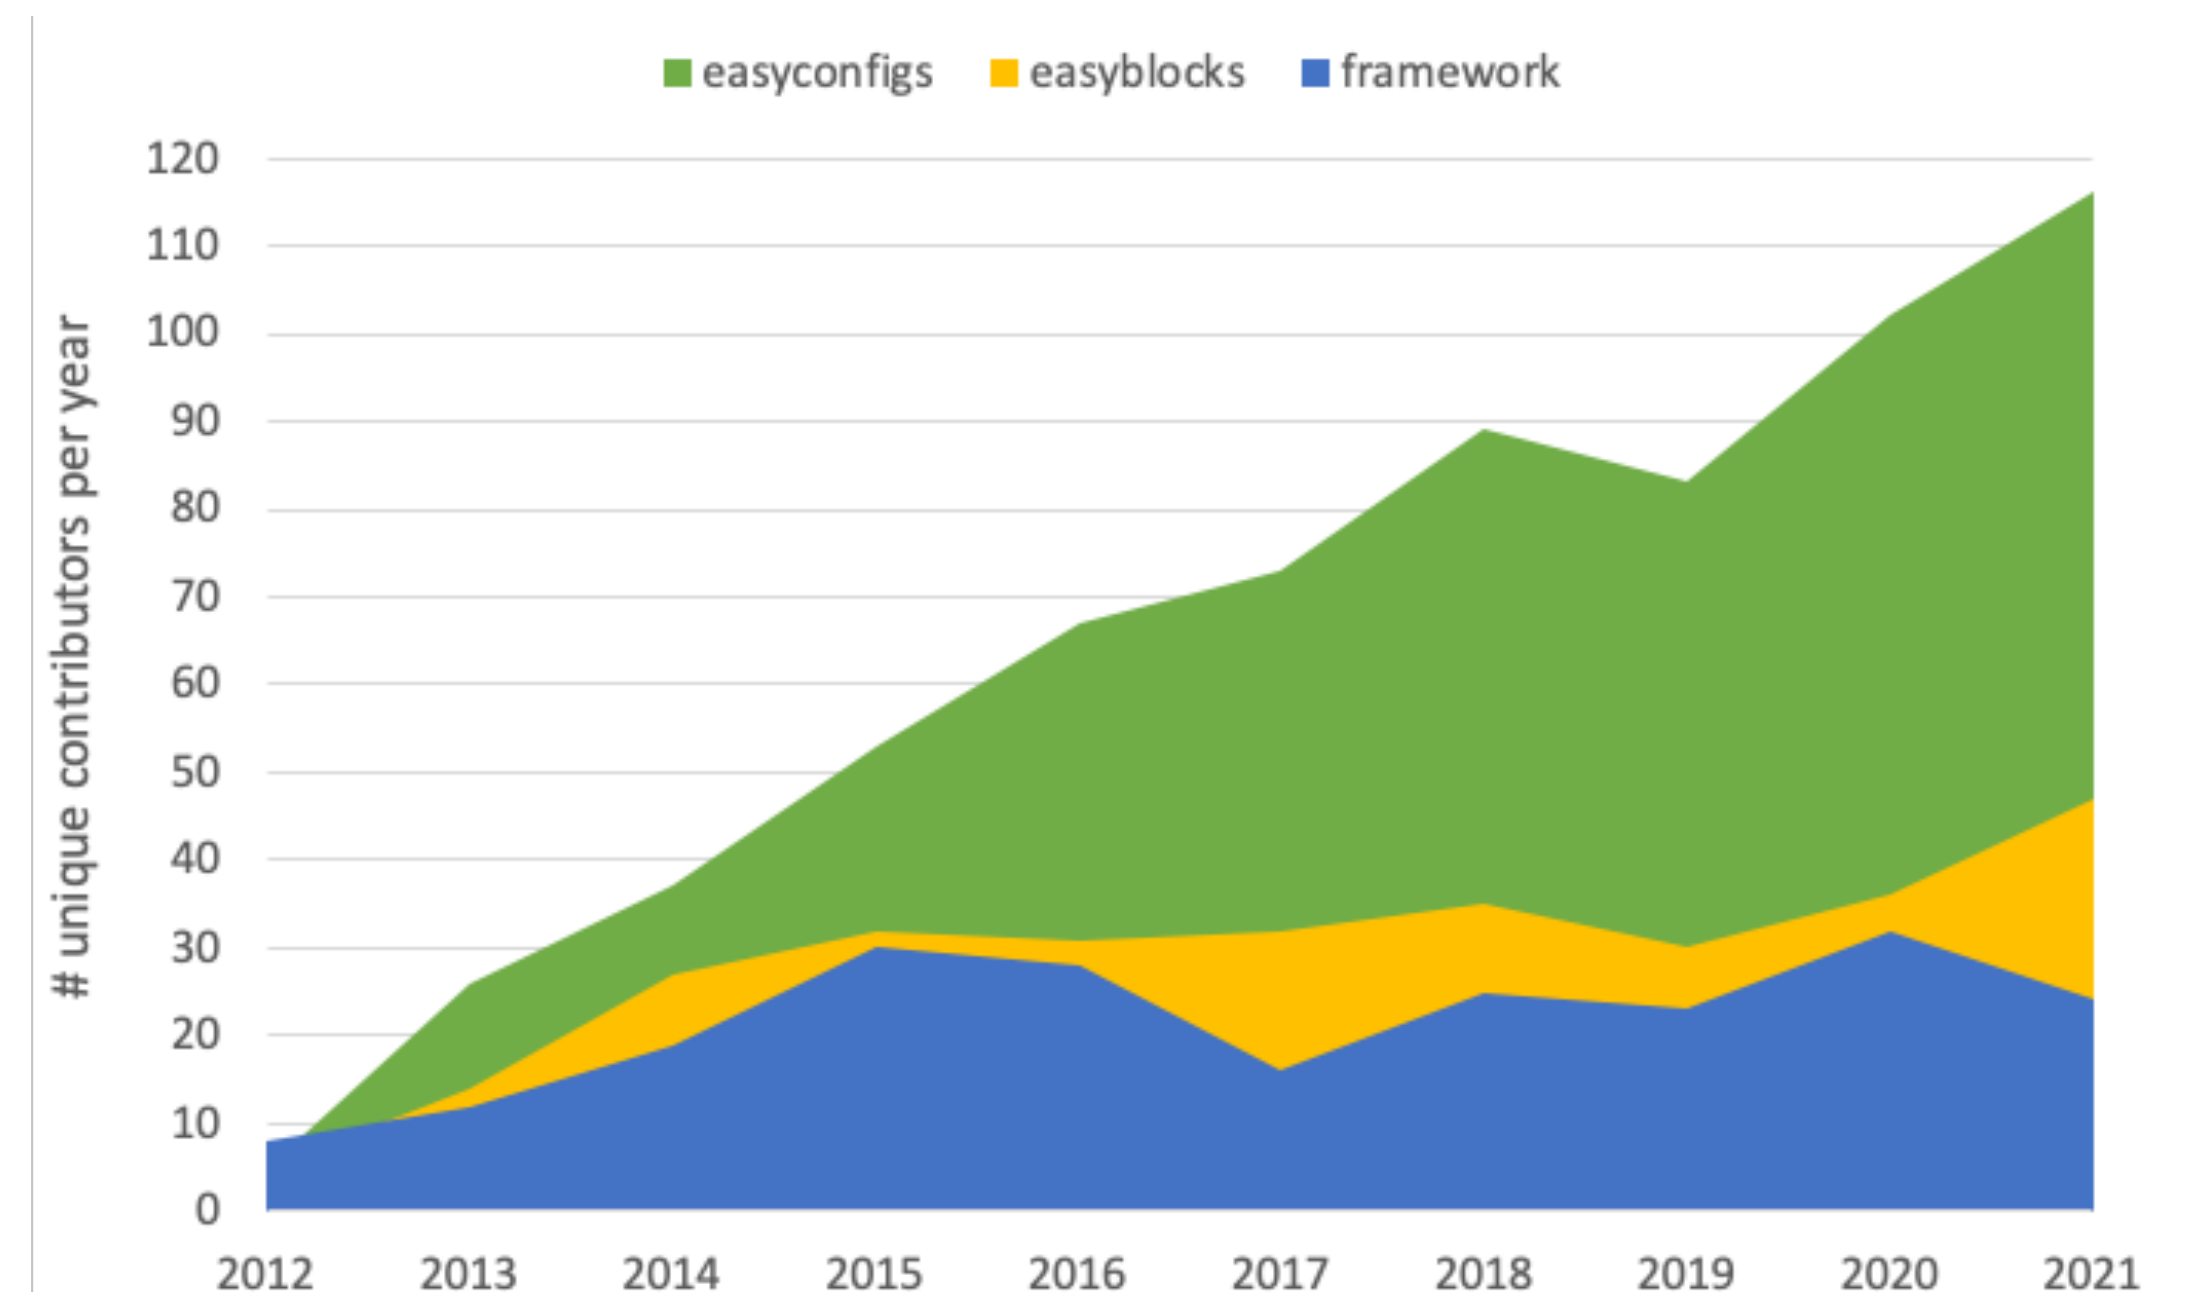

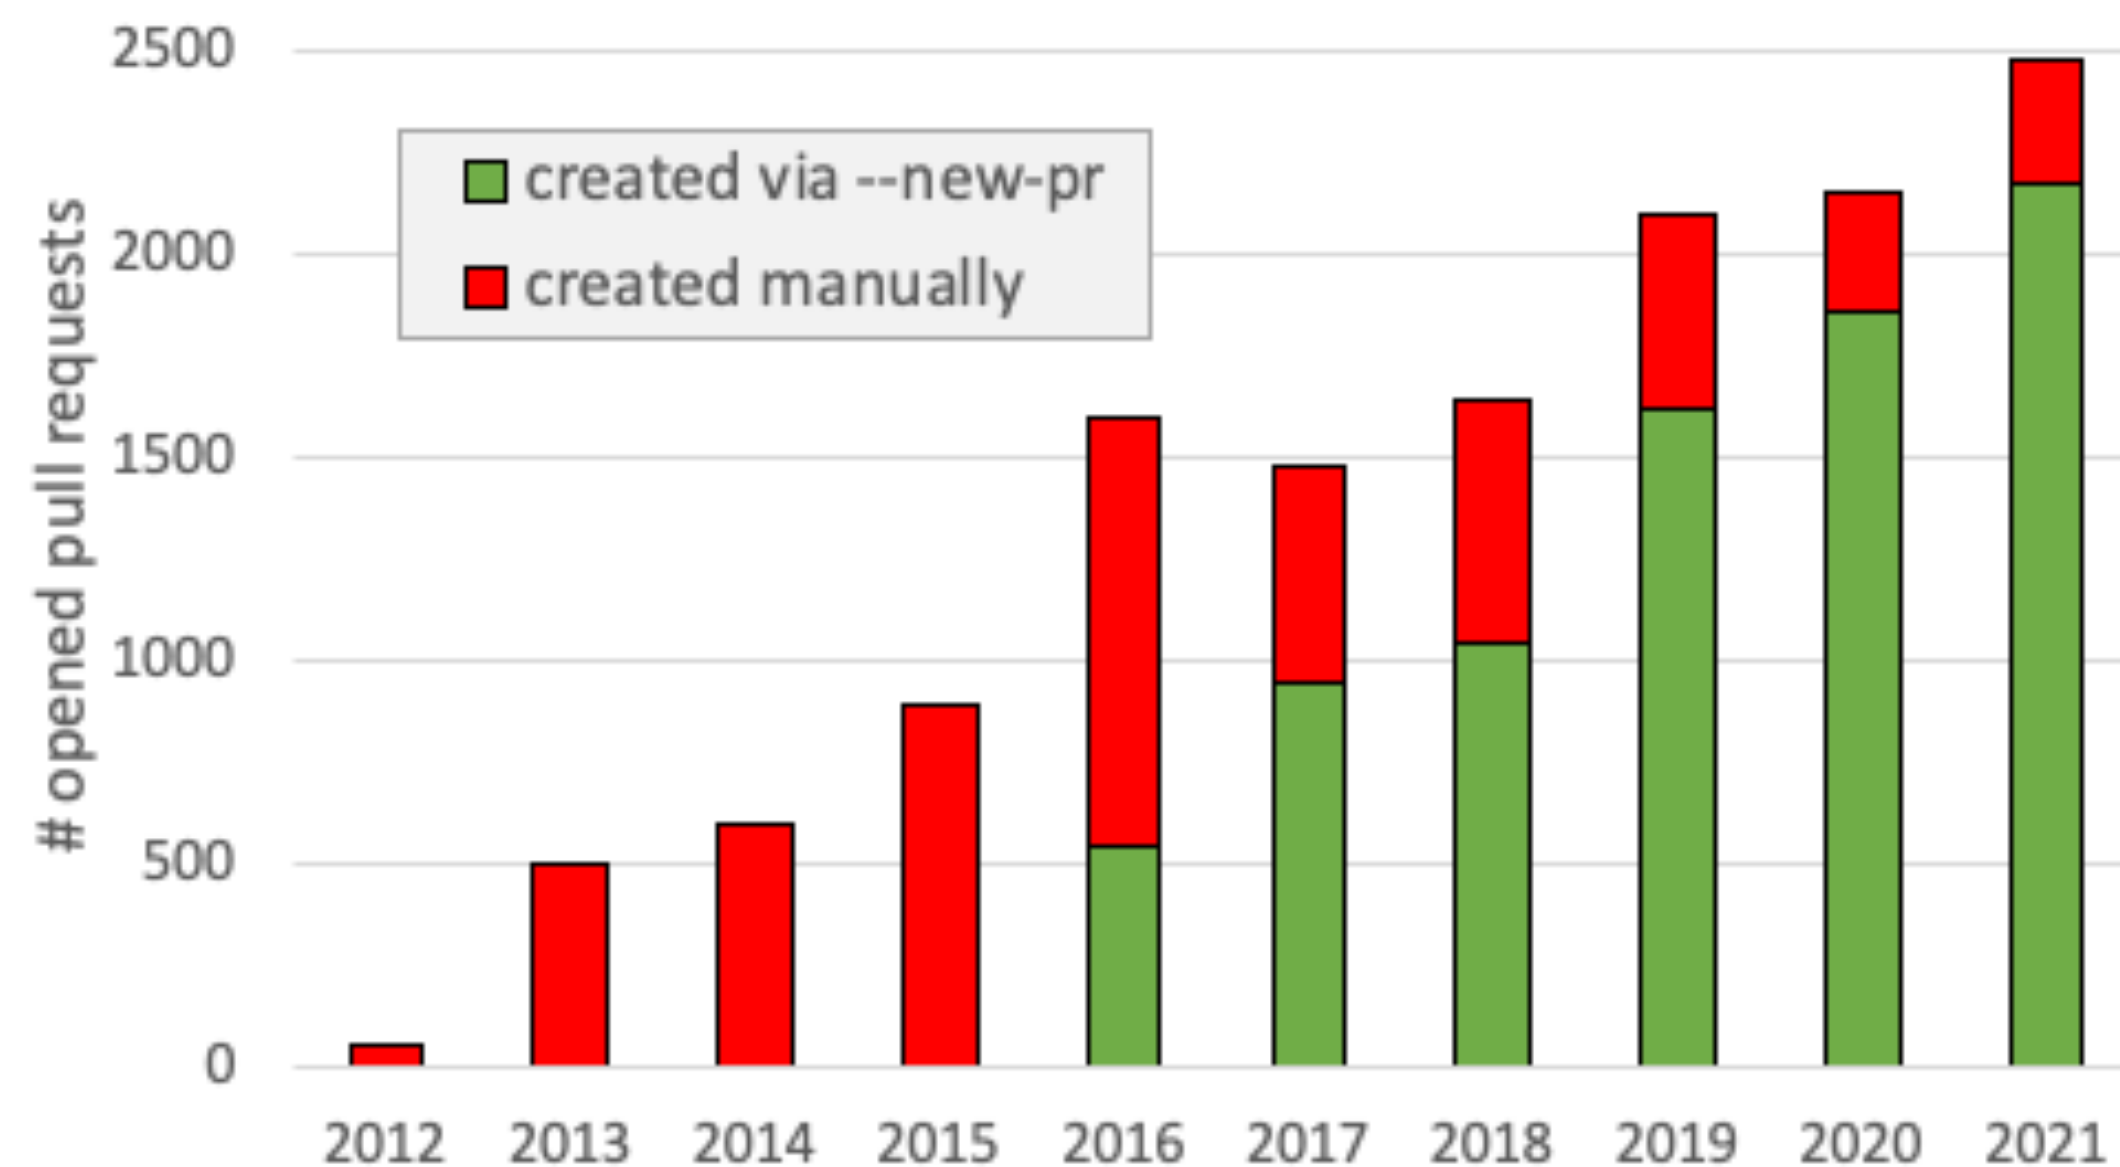

Installing extensions in parallel

- **Make EasyBuild leverage available cores to install multiple extensions concurrently**
`eb R.eb --parallel-extensions-install --experimental`
- Only works for R packages, extensions installed in dependencies not taken into account yet
- Significant speedup for R easyconfigs (which include over 1,000 extensions...)
- For other types of extensions (Python, ...) we need to know how to extract dependencies
- More info: docs.easybuild.io/en/latest/Installing_extensions_in_parallel.html
- **Experimental feature** - requires configuring EasyBuild to enable using it - subject to change

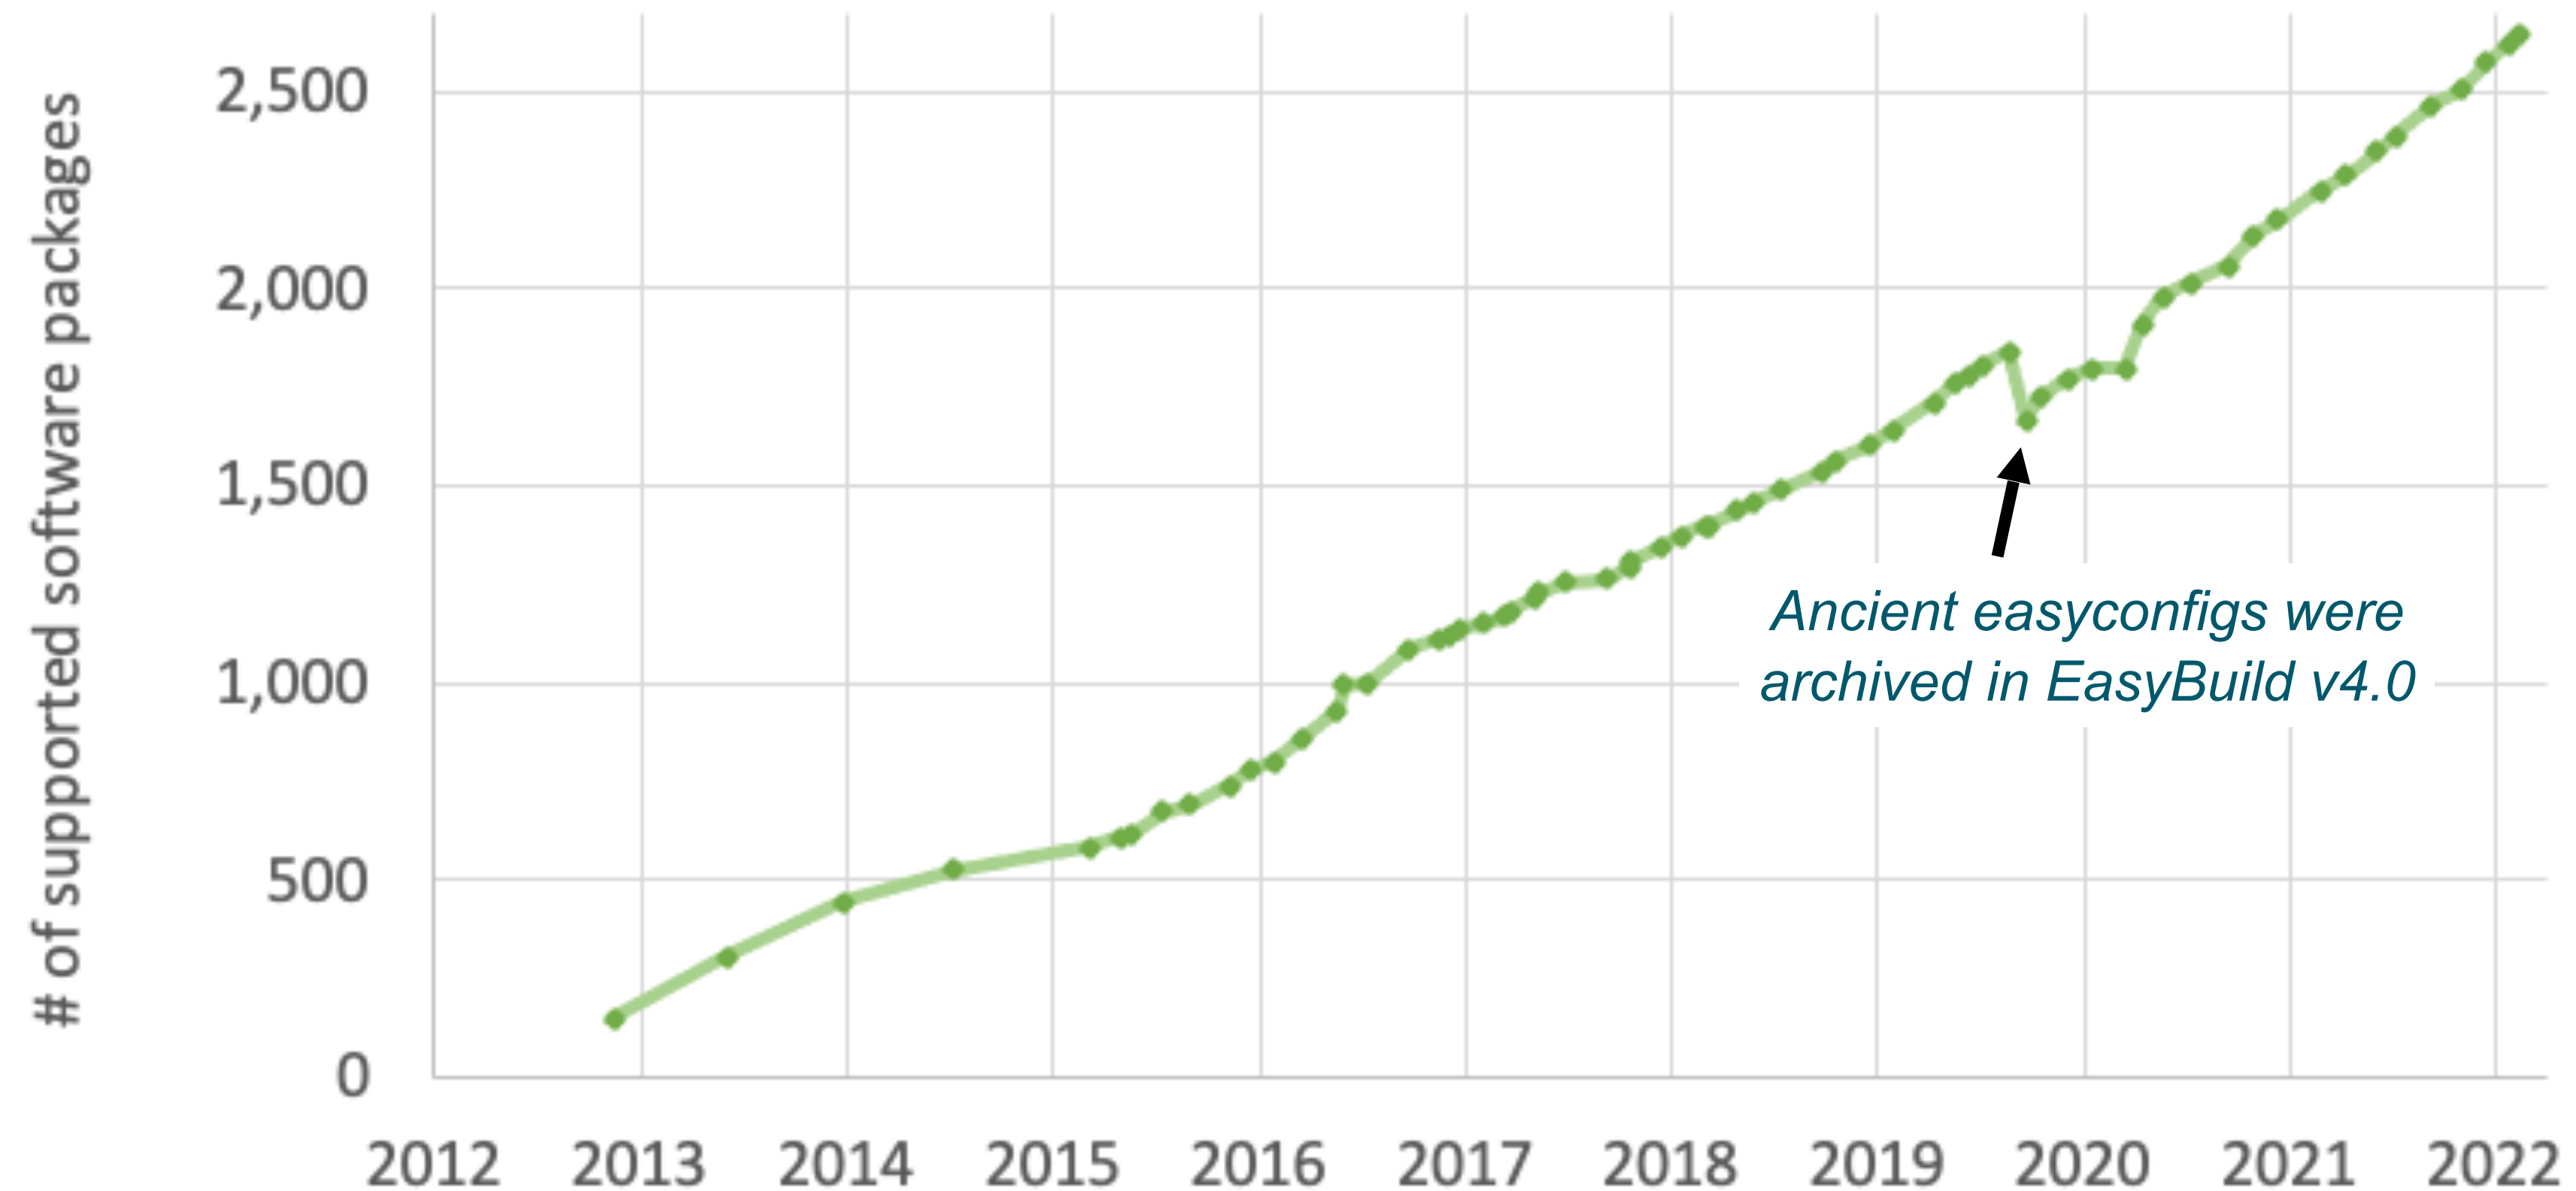

Community contributions

- **Growing number of community contributions:** close to 2,500 easyconfig PRs per year!
- Over 100 unique contributors per year (and steadily increasing)
- Significant impact of GitHub integration features like `eb --new-pr` , see docs.easybuild.io/en/latest/Integration_with_GitHub.html

Community contributions

Evolution of number of supported software packages in EasyBuild (excl. extensions)

Over 2,600 different software supported by EasyBuild v4.5.3 (plus ~2,000 extensions)

Stable upward trend, no sign of slowing down...

Landscape of computational science is changing

- **Explosion of available scientific software applications**

- Broader scope in terms of scientific domains (bioinformatics, AI, ...)
- Fueled by recent shifts in scientific community
 - Pressure to publish code along with research articles + popularity of GitHub
 - Wider adoption of HPC across scientific domains (GPUs in bioinformatics, ...)

- **Increasing interest in using cloud infrastructure** (both private and commercial)

- **Increasing variety in processor (micro)architectures**

- Intel + AMD, ARM, POWER, soon also RISC-V? (cfr. European Processor Initiative, ...)
- In addition, GPUs (NVIDIA, AMD, soon Intel?) and other accelerators (TPUs, IPUs, ...)

- **In stark contrast: available manpower in HPC support teams...**

It is time to take the next step...

- EasyBuild helps a lot with managing scientific software stacks, but it's not enough anymore...
- **HPC sites are *still* losing way too much time in getting scientific software installed**
 - Installation requests for new software often require significant investment & expertise
 - Problems occur due to site-specific differences in system setup & configuration
 - Small details (OS packages, disk partitioning, ...) can cause trouble
- **Situation is getting *worse*, not better:** more software, increasing variety in hardware, ...
- **There is a lot of potential for more extensive collaboration beyond installing software**
 - Ensuring correctness of installations w.r.t. scientific results they produce
 - Evaluating performance of provided installations + performance monitoring
 - ReFrame developed by CSCS is definitely a step in the right direction!

Introducing EESSI...

- *European Environment for Scientific Software Installations*
- Collaborative project, by and for the computational science community
- **Shared central stack of (optimized) scientific software installations**
- Uniform way of providing software to users, regardless of system they use
- Should work regardless of OS and system architecture (HPC, cloud, ...)
- Focus on **performance**, automation, testing, collaboration

E E S S I
EUROPEAN ENVIRONMENT FOR
SCIENTIFIC SOFTWARE INSTALLATIONS

www.eessi-hpc.org

eessi.github.io/docs (try out pilot repository!)

High-level overview of EESSI

Testing ReFrame

Software layer
optimized installations of applications + dependencies

Compatibility layer
 levelling the ground across Linux distros
 ("*containers without the containing*")

Filesystem layer
global distribution of the software stack

Host OS provides network & GPU drivers, resource manager (Slurm), ...

host operating system (any Linux distribution)

Heavily inspired by

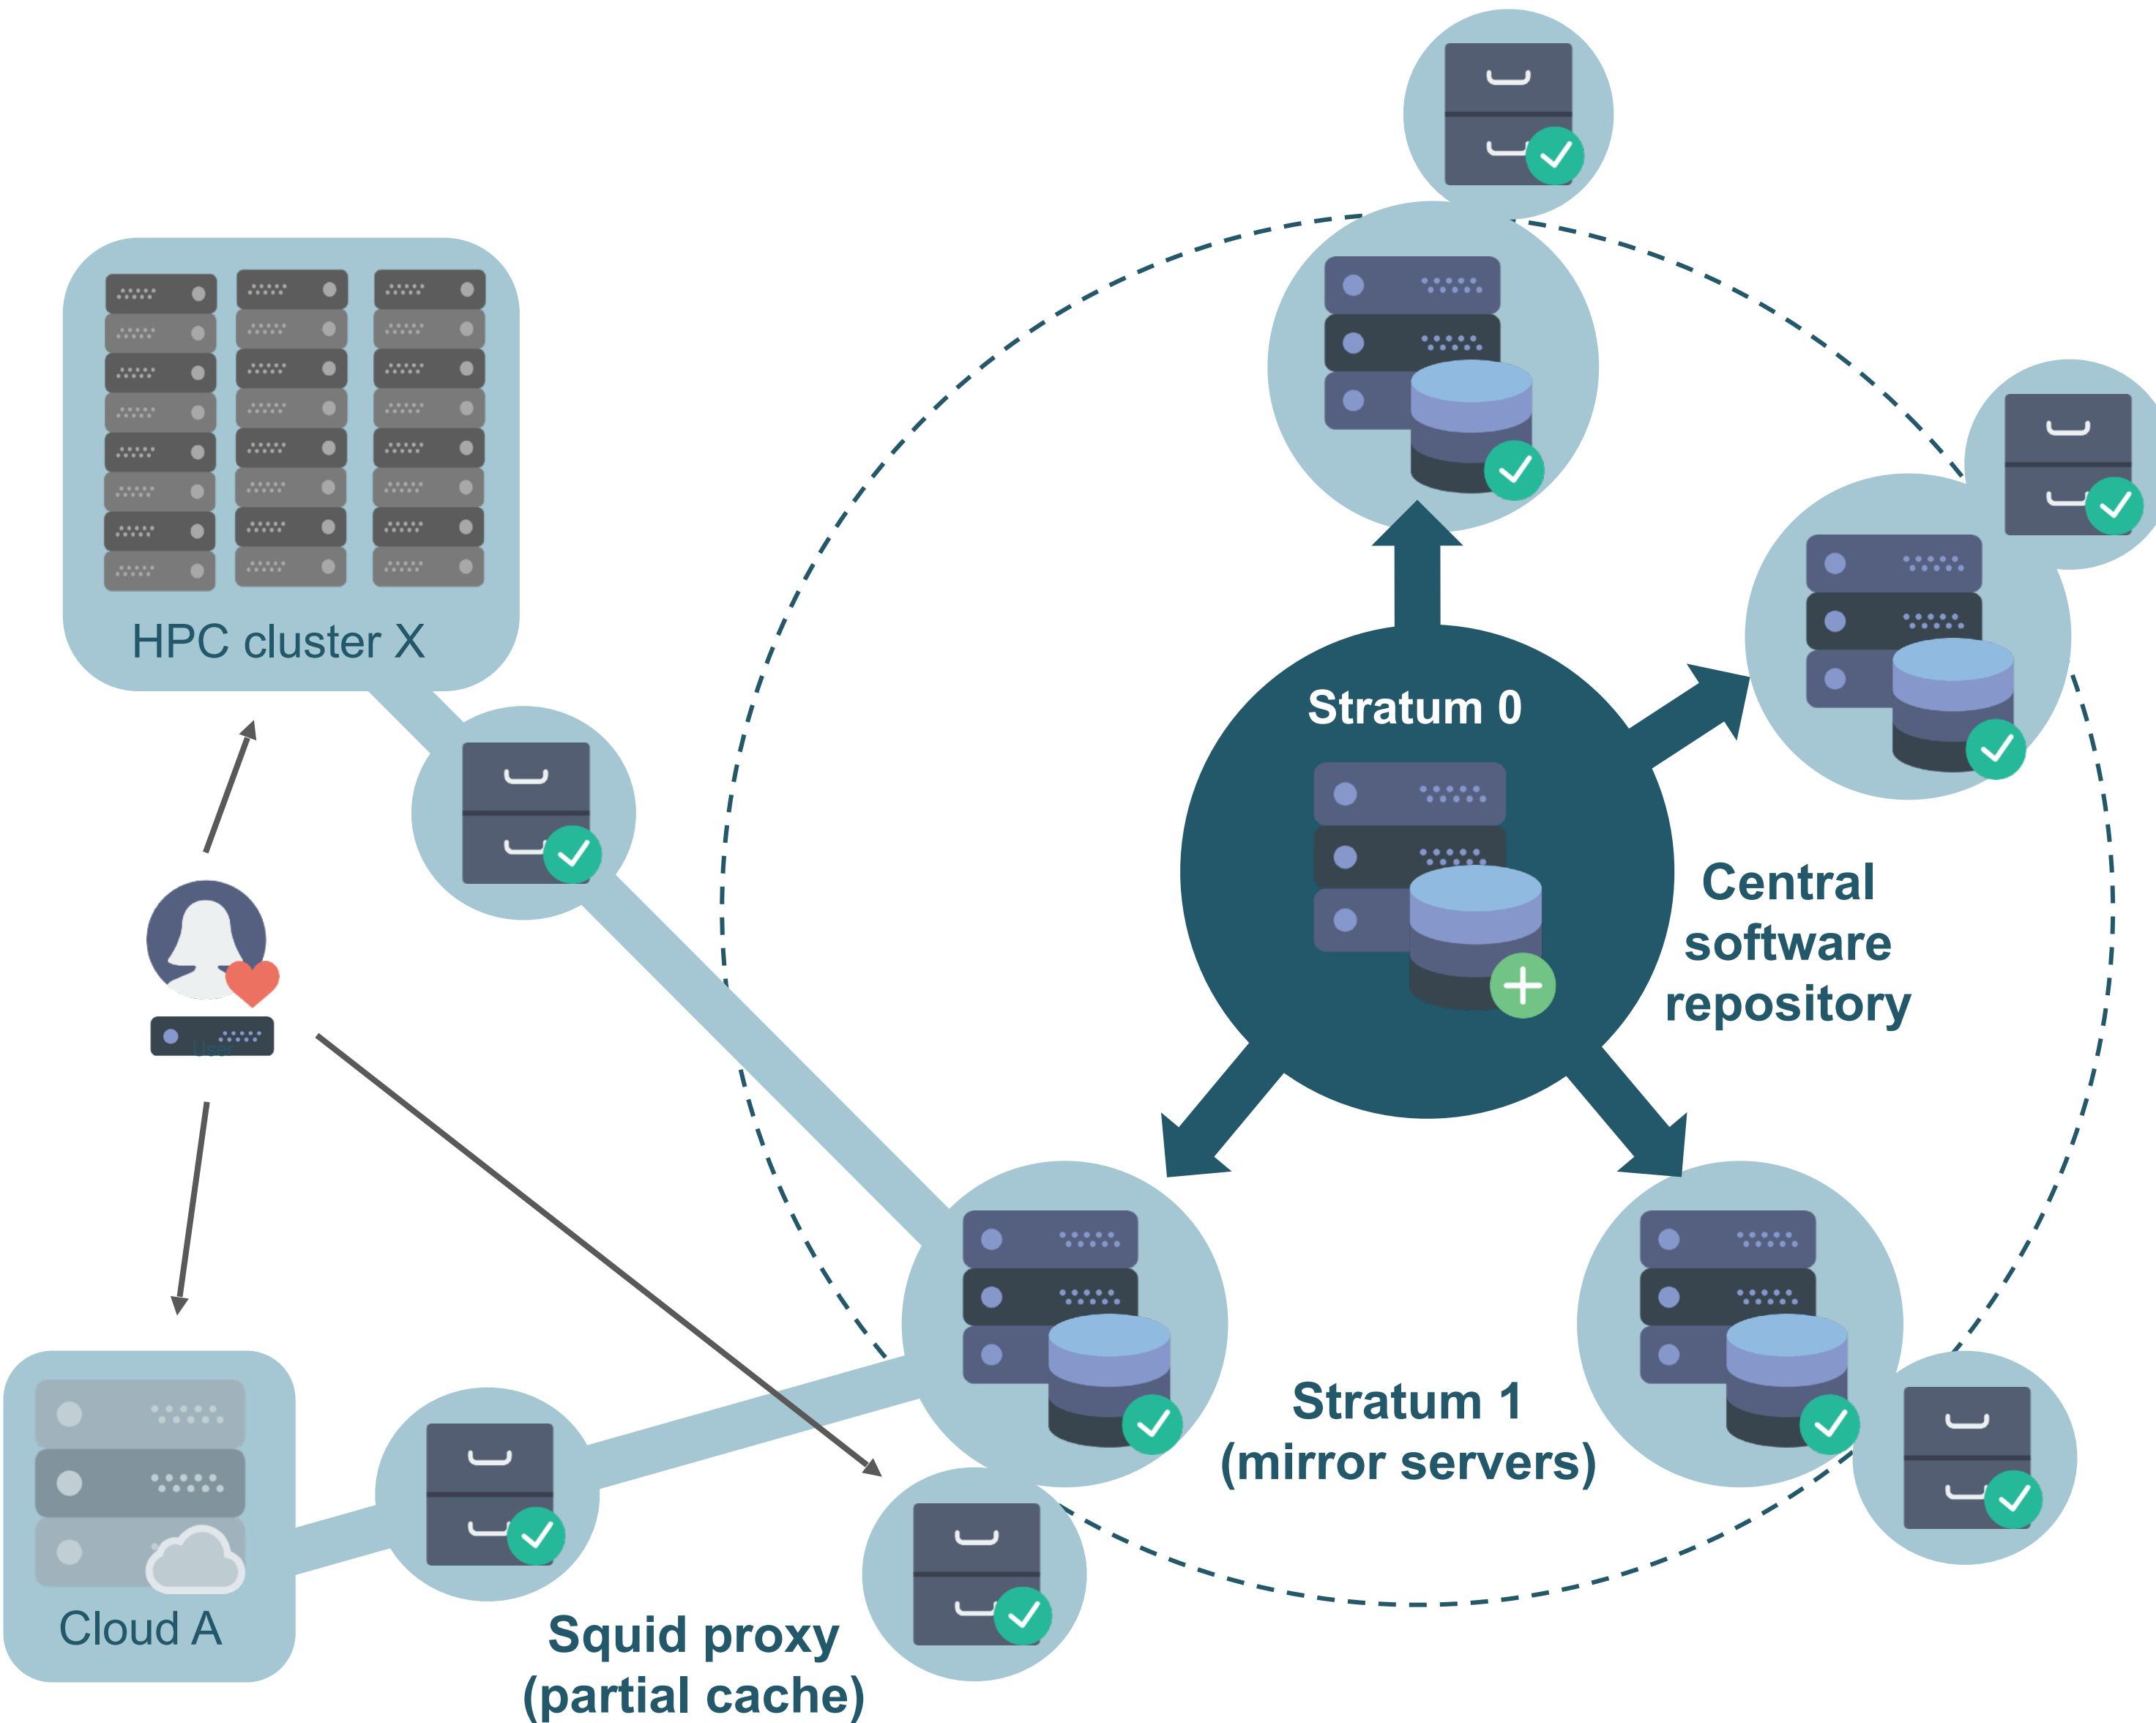

software stack 19

Software distribution via CernVM-FS

CernVM-FS

<https://cvmfs.readthedocs.io>

- Global distribution of software *installations*
- Software is downloaded *on-demand* over HTTP
- Transparent for end users, feels like local software
- Added software is *automatically* picked up
- Redundant network of “mirror” servers
- Multiple levels of caching (start-up performance)
- **Same software stack everywhere:**
laptops, workstations, HPC clusters, cloud VMs, ...

From zero to science in 3 steps

- Step 1: Get access to EESSI repository, either through:
 - system-wide CernVM-FS installation (requires admin privileges)
 - container with CernVM-FS + EESSI configuration pre-installed
- Step 2: Set up environment: source EESSI init script
- Step 3: Load module(s) and run!

eessi.github.io/docs/pilot
github.com/eessi/eessi-demo

```
# Assumed status: EESSI is accessible (CernVM-FS installed + EESSI configuration in place)
```

```
# Step 2: set up environment (CPU architecture is detected automatically)
```

```
$ source /cvmfs/pilot.eessi-hpc.org/latest/init/bash
```

```
# Step 3: load module(s) to activate software (check with 'module avail'), and run!
```

```
[EESSI pilot 2021.06] $ module load GROMACS
```

```
[EESSI pilot 2021.06] $ gmx mdrun ...
```

Use cases

- A **uniform software stack** across HPC clusters, clouds, servers and laptops
- Can be leveraged in **continuous integration** (CI) environments for software testing
- Significantly facilitates setting up **infrastructure for HPC training**
 - Using throwaway clusters in the cloud
 - Participants can easily get access to same software environment "at home"
- **Enhanced collaboration** with software developers and application experts
 - Work towards "vetting" of scientific software installations included in EESSI
 - Relieve developers from burden of getting their software (properly) installed
- **Community software and portable workflows**

Current status

- Started as an idea in Feb'20, effort kickstarted that same year
- Monthly online meetings since mid 2020
- Currently an unfunded "side project", actively pursuing dedicated project funding...
- **Work-in-progress, proof-of-concept pilot repository available** - eessi.github.io/docs/pilot
 - Supports x86_64 (Intel, AMD), aarch64 (Arm 64-bit), ppc64le (POWER)
 - Included software: Bioconductor, GROMACS, OpenFOAM, R, TensorFlow, ...
 - Targets: Intel Haswell + Skylake, AMD Rome + Milan, AWS Graviton2, POWER9 (partial)
- Significant amount of sponsored credits provided by both AWS and Azure
- Actively developing monitoring, tooling, test suite, GPU support, contribution workflow, etc.

EESSI paper (open access)

doi.org/10.1002/spe.3075

Detailed overview of motivation, project goals, design, challenges & limitations, use cases, etc.

Wiley Online Library

RESEARCH ARTICLE | [Open Access](#) |   

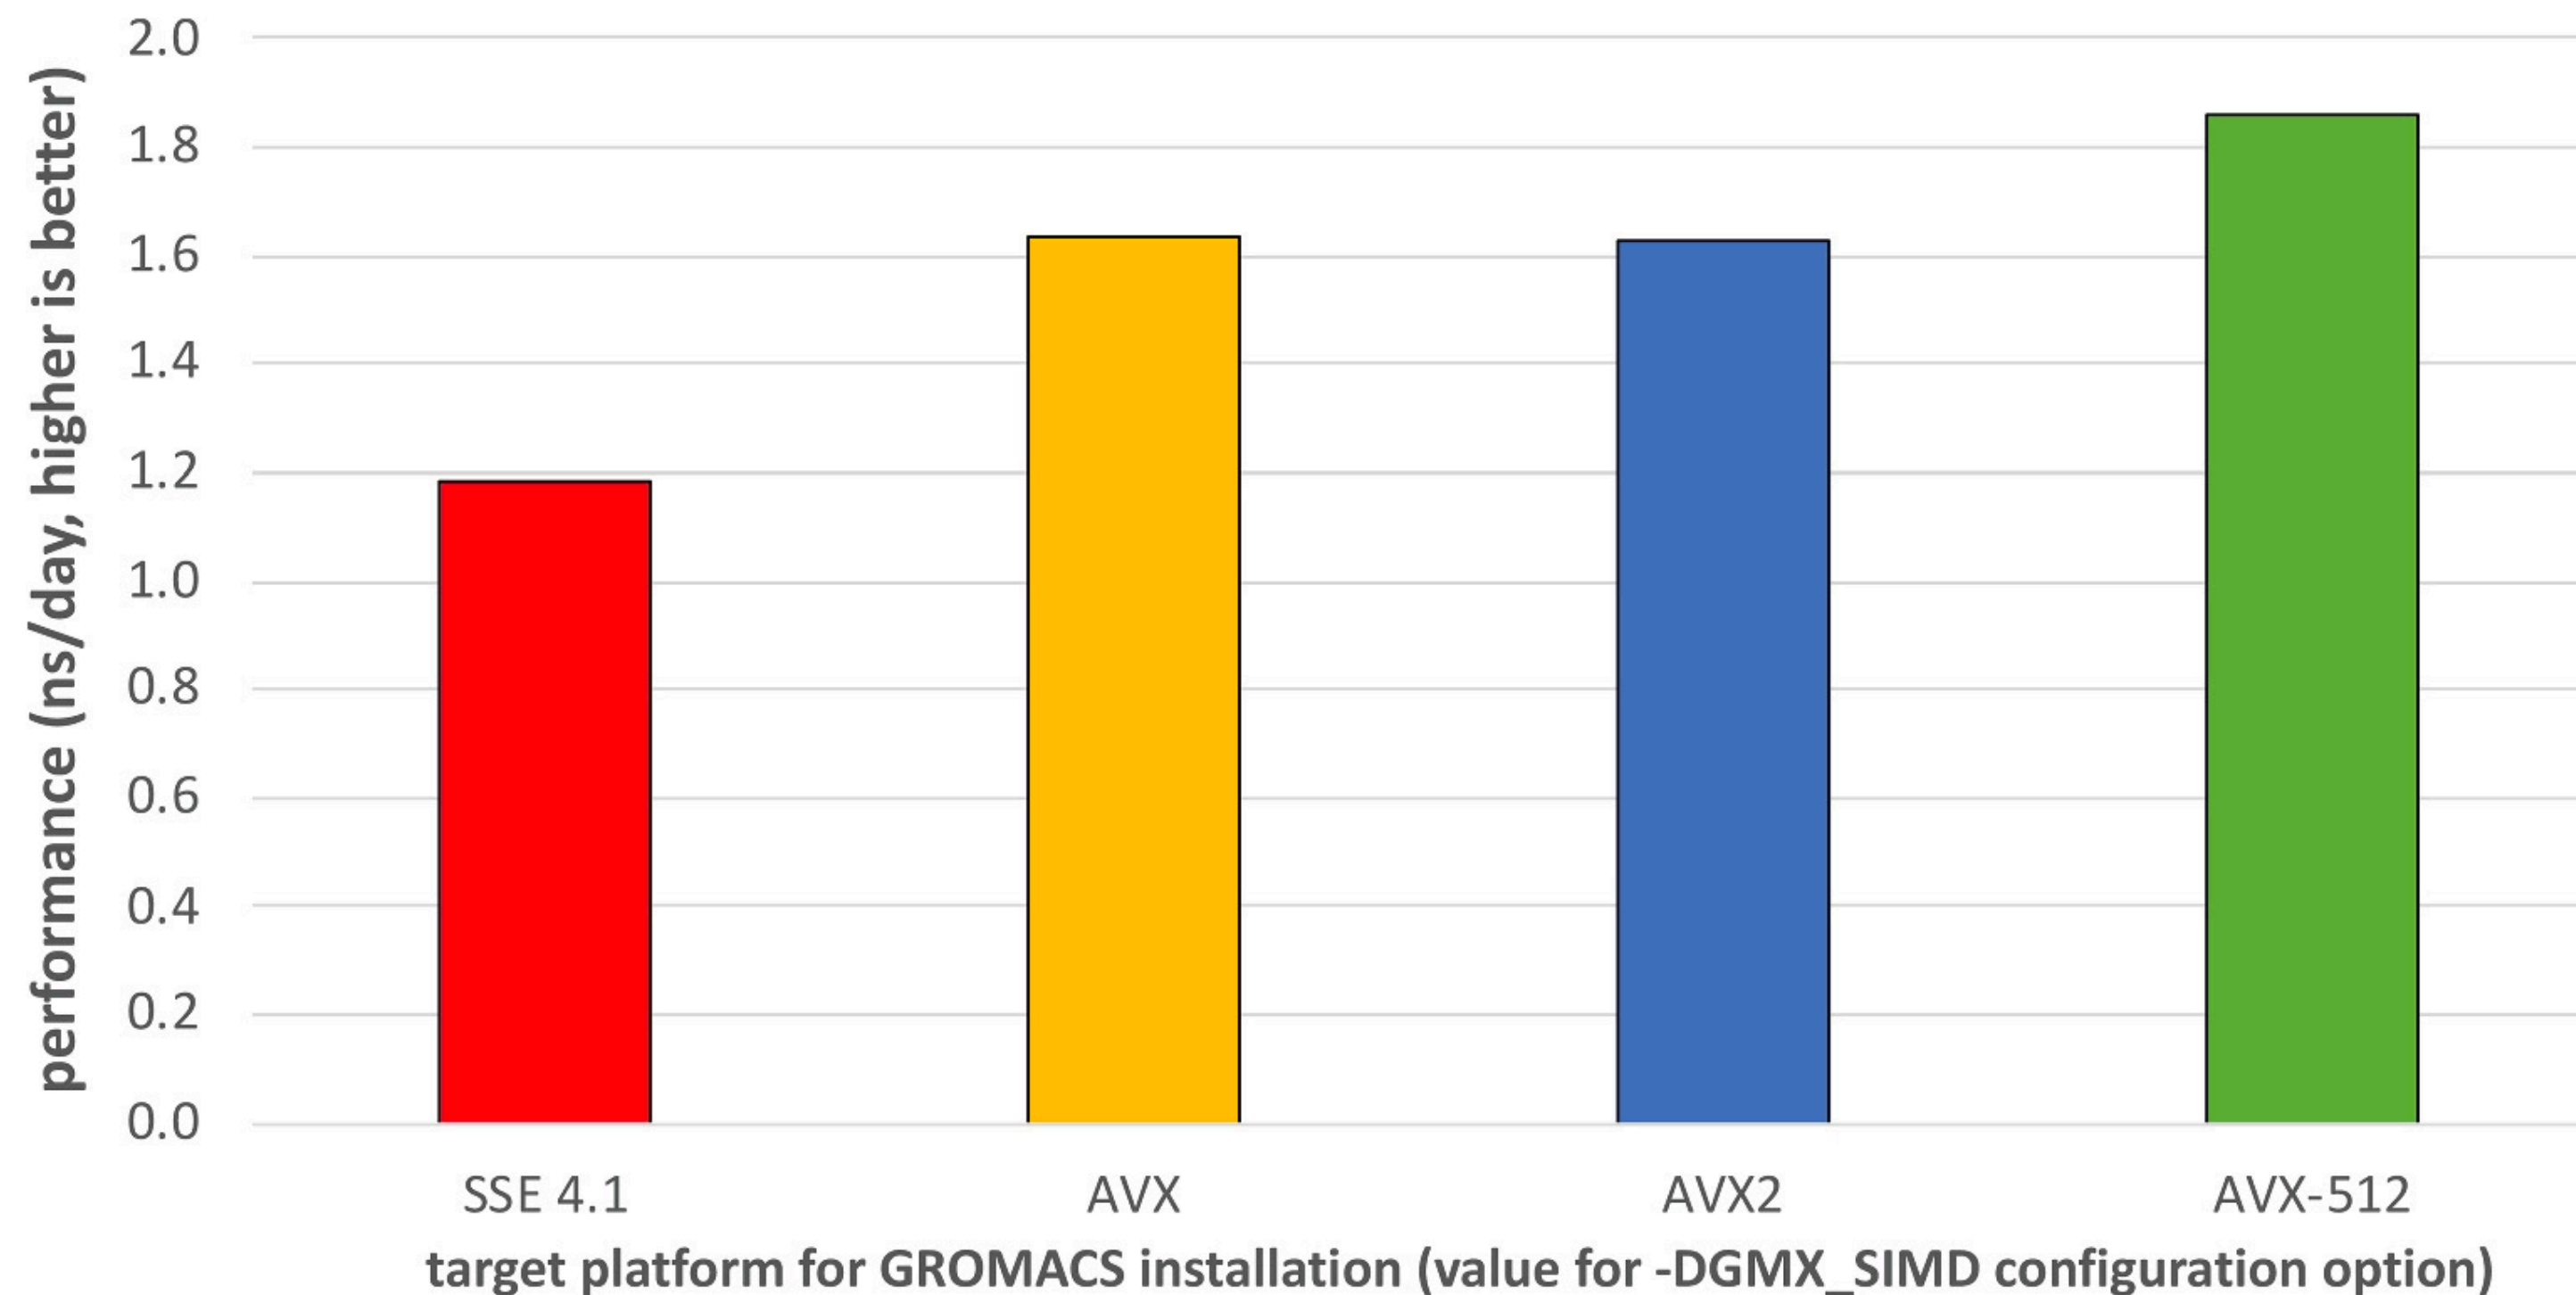

EESSI: A cross-platform ready-to-use optimised scientific software stack

Bob Dröge (Univ. of Groningen) , Victor Holanda Rusu (CSCS), Kenneth Hoste (HPC-UGent), Caspar van Leeuwen (SURF), Alan O'Cais (JSC), Thomas Röblitz (Univ. of Bergen)

First published: 16 February 2022

EESSI paper (open access)

doi.org/10.1002/spe.3075

- Motivation for EESSI: keeping the 'P' in HPC (also when using cloud or containers)
- Impact of target instruction set for GROMACS: 57% speedup on CPUs that support AVX-512
- When using containers, performance is often sacrificed for "mobility of compute"...

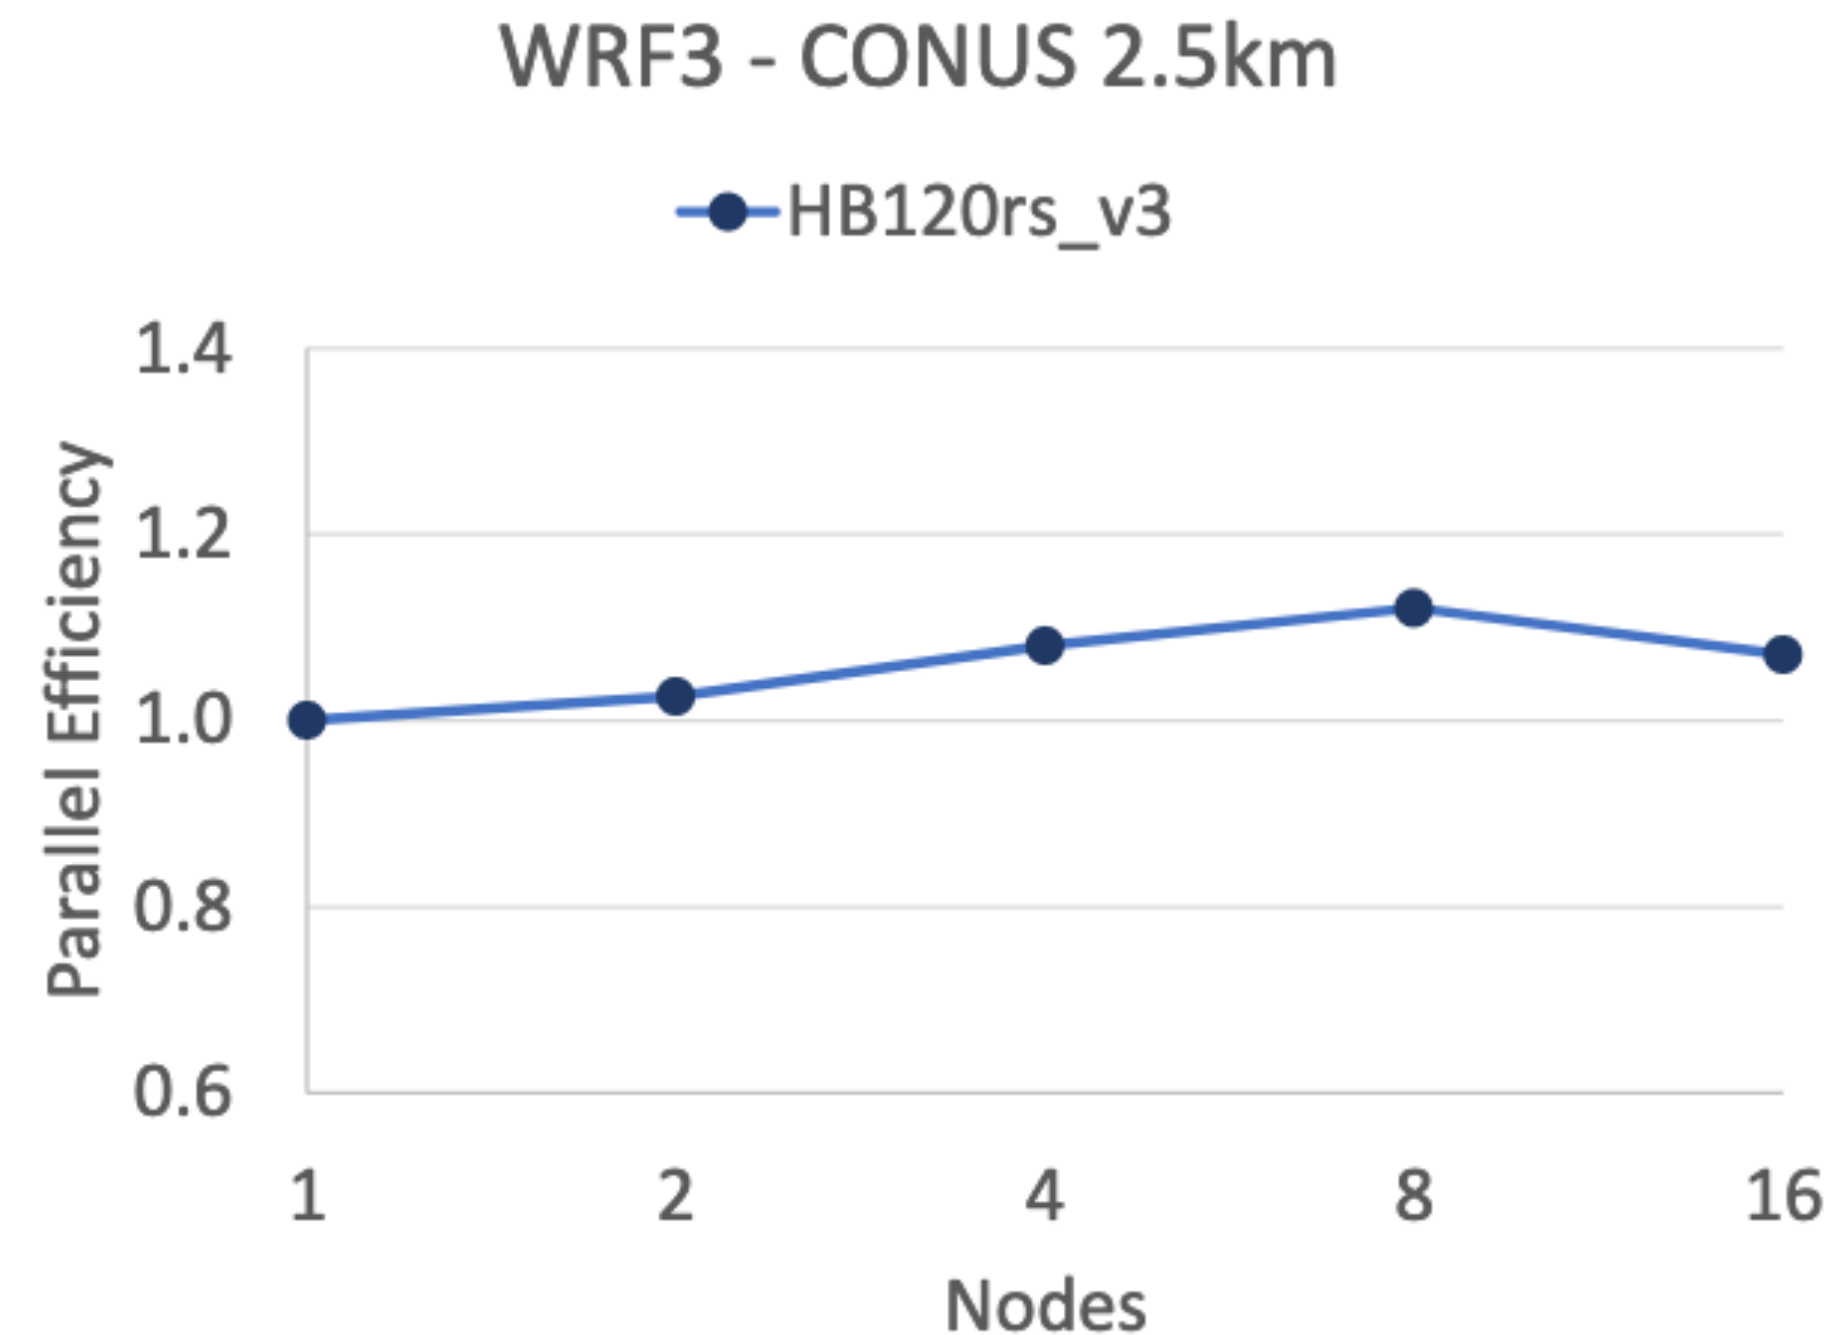

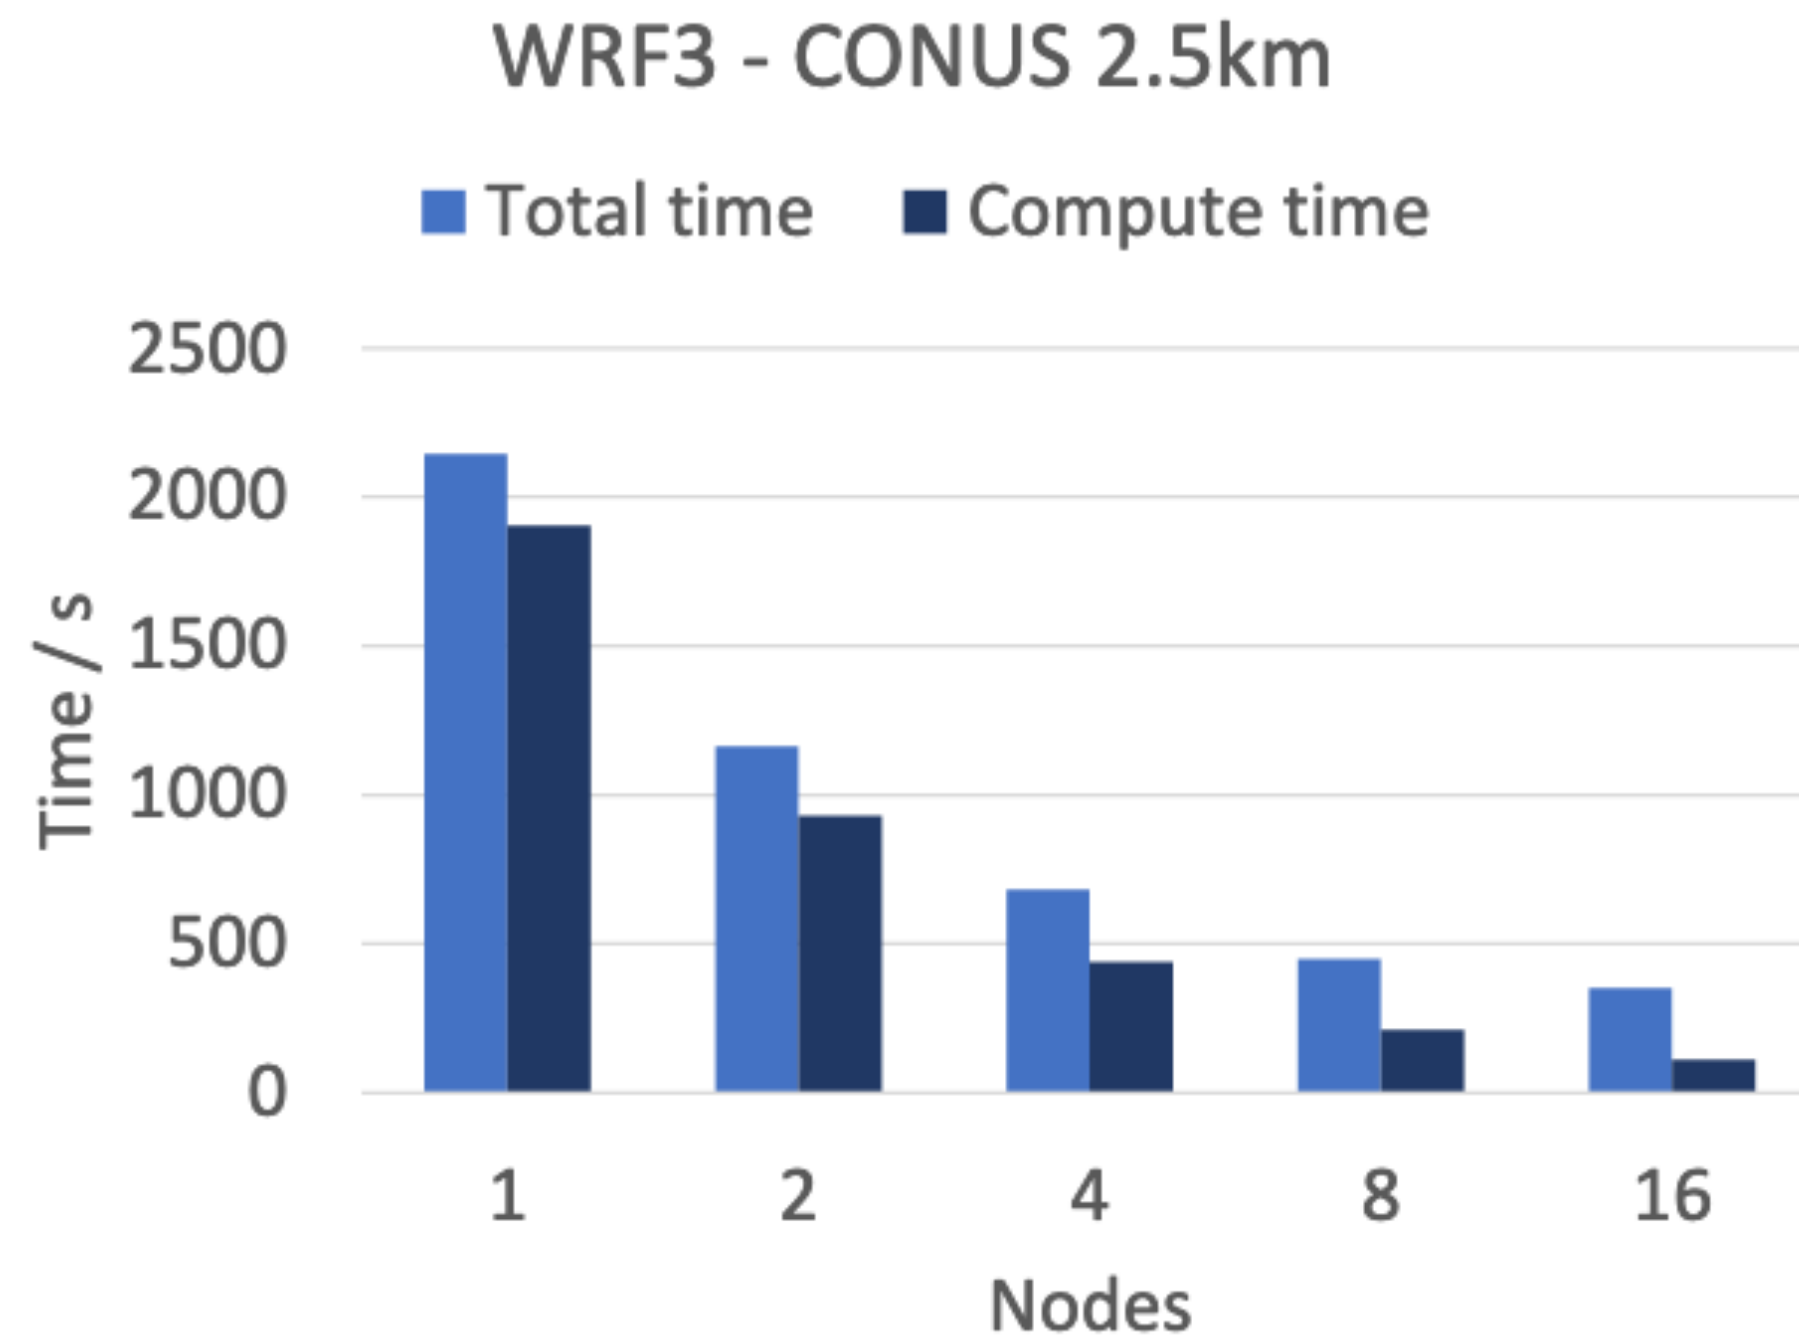

EESSI paper (open access)

doi.org/10.1002/spe.3075

- Paper includes proof-of-concept performance evaluation compared to system software stack
- Performed at JUSUF @ JSC using GROMACS 2020.4, up to 16,384 cores (CPU-only)

Running WRF in Azure via EESSI

- Performance experiment by Hugo Meiland & Davide Vanzo (Microsoft Azure), for their EUM'22 talk "[Leveraging EESSI for WRF simulations at scale on Azure HPC](#)"
- WRF v3.9.1.1 with `foss/2020a` on `HB120rs_v3` (120 cores, AMD EPYC 7V13, HDR Infiniband)
- Essentially using EESSI pilot repository as is, no changes needed to leverage fast interconnect!
