Introduction to HPC @ UGent

February 11th 2014

ewan.higgs@ugent.be
kenneth.hoste@ugent.be
ewald.pauwels@ugent.be

hpc@ugent.be

HPC-UGent: quick introduction

- part of central ICT department (DICT UGent)
- established in 2008
- central contact for scientists w.r.t. high-performance computing
- tasks:
  - maintain HPC infrastructure at UGent
  - support and train users

The HPC-UGent team

Stijn De Weirdt
technical lead

Ewald Pauwels
team lead

Kenneth Hoste
user support, EasyBuild

Wouter Depypere
system administration (Tier1)

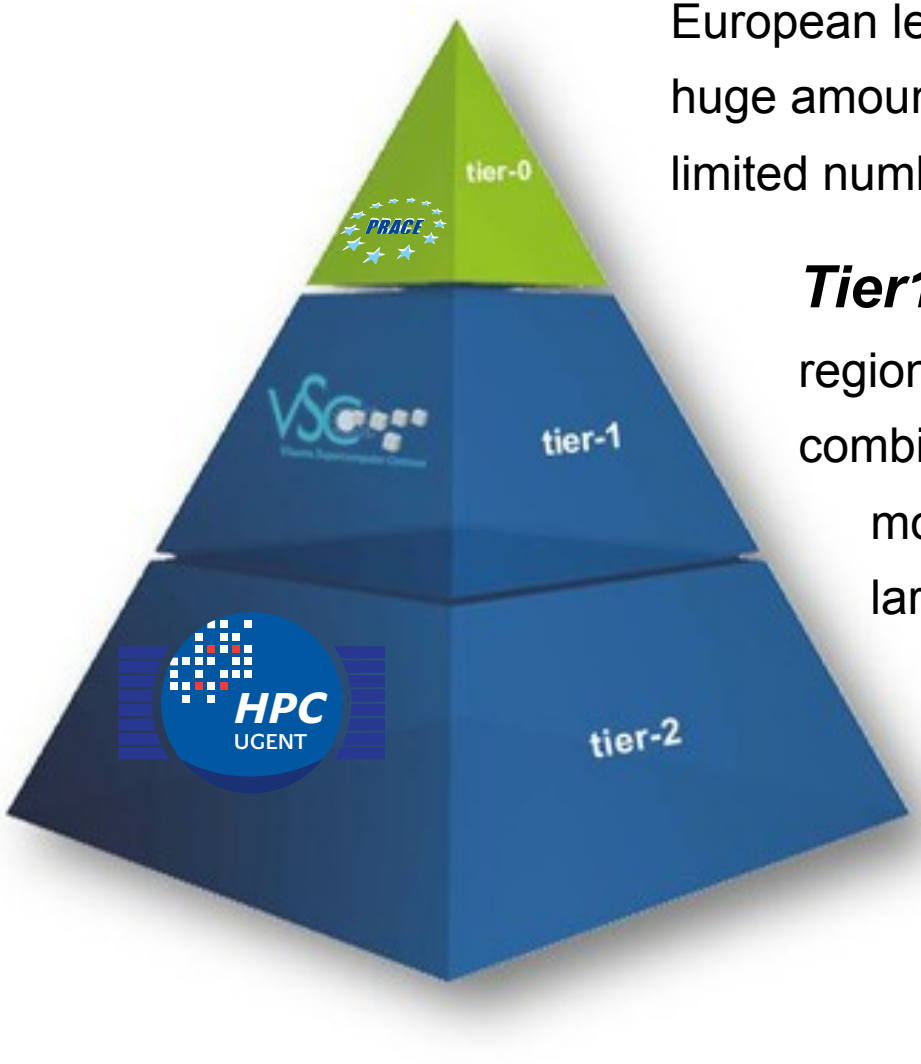
Jens Timmerman
user support & system administration

Ewan Higgs
user support

Andy Georges
user support & system administration

Kenneth Waegeman
system administration (storage)

HPC in Europe: Tier pyramid



Tier0: capacity computing

European level computing centers

huge amount of computing power on a single location

limited number of users, very competitive

Tier1: capability/capacity computing

regional/national computing centers

combines:

- modest computing power on multiple locations
- large shared computing power

Tier2: capacity computing

local computing centers

large number of users

computing power spread out over multiple locations

HPC-UGent infrastructure: **Tier2** (STEVIN)

gengar

- first HPC-UGent cluster (early 2009)
- #496 in Top500 of supercomputers (Nov 2008)
- includes (current) GPFS shared storage (~60TB)
- originally 194 workernodes, currently about 140
- fast (and expensive) Infiniband network, intended for MPI

	gengar
vendor	IBM (Intel)
year	2009
location	basement rectoraat
nodes	140
cores / node	2x4 (1,200 total)
memory / node	16GB (2GB/core)
CPU	Harpertown
clock speed	2.5GHz
OS	Scientific Linux 5
interconnect	Infiniband DDR
topology	full non blocking
power	85 kW
comments	blades

HPC-UGent infrastructure: **Tier2** (STEVIN)

gastly & haunter

- batch clusters to feed with ‘smaller’ tasks
- ‘regular’ Ethernet network
- NFS mount to (scratch) shared storage
- intended for:
  - single-node (and single-core) jobs
  - non-IO-intensive jobs

	gengar	*gastly*	*haunter*
vendor	IBM (Intel)	IBM (Intel)	IBM (Intel)
year	2009	2009	2010
location	basement rectoraat	datacenter S10	UZ MRB basement
nodes	140	56	168
cores / node	2x4 (1,200 total)	2x4 (448 total)	2x4 (1,344 total)
memory / node	16GB (2GB/core)	12GB (1.5GB/core)	12GB (1.5GB/core)

interconnect	Infiniband DDR	ethernet	ethernet
topology	full non blocking	-	-
power	85 kW	20 kW	45 kW
comments	blades	blades	IDPX (water cooled)

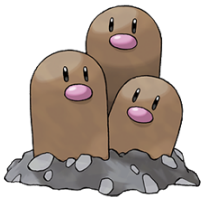
HPC-UGent infrastructure: **Tier2** (STEVIN)

gulpin

- second Infiniband cluster for demanding MPI jobs
- powered by AMD processors (as opposed to Intel)
- dedicated scratch storage (~53TB)

	gengar	*gastly*	*haunter*	*gulpin*
vendor	IBM (Intel)	IBM (Intel)	IBM (Intel)	Dell (AMD)
year	2009	2009	2010	2011
location	basement rectoraat	datacenter S10	UZ MRB basement	datacenter S10
nodes	140	56	168	34
cores / node	2x4 (1,200 total)	2x4 (448 total)	2x4 (1,344 total)	4x8 (1,088 total)
memory / node	16GB (2GB/core)	12GB (1.5GB/core)	12GB (1.5GB/core)	64GB (2GB/core)
CPU	Harpertown	Nehalem	Nehalem	Magny Cours
clock speed	2.5GHz	2.26GHz	2.26GHz	2.4GHz
OS	Scientific Linux 5	Scientific Linux 5	Scientific Linux 5	Scientific Linux 6
interconnect	Infiniband DDR	ethernet	ethernet	Infiniband 2x QDR
topology	full non blocking	-	-	full non blocking
power	85 kW	20 kW	45 kW	27 kW
comments	blades	blades	IDPX (water cooled)	

HPC-UGent infrastructure: **Tier2** (STEVIN)



dugtrio

- special-purpose system:
  - ‘reverse virtualization’ via ScaleMP vSMP software
- Infiniband interconnect (not exposed)
- shared storage via NFS, large (virtual) local disks
- current config:
  3x 48-core (~360GB RAM) + 2x 24-core (~190GB RAM)

	gengar	*gastly*	*haunter*	*gulpin*	*dugtrio*
vendor	IBM (Intel)	IBM (Intel)	IBM (Intel)	Dell (AMD)	Dell (Intel)
year	2009	2009	2010	2011	2011
location	basement rectoraat	datacenter S10	UZ MRB basement	datacenter S10	datacenter S10
nodes	140	56	168	34	16
cores / node	2x4 (1,200 total)	2x4 (448 total)	2x4 (1,344 total)	4x8 (1,088 total)	2x6 (196 total)
memory / node	16GB (2GB/core)	12GB (1.5GB/core)	12GB (1.5GB/core)	64GB (2GB/core)	128GB (8GB/core)
CPU	Harpertown	Nehalem	Nehalem	Magny Cours	Westmere
clock speed	2.5GHz	2.26GHz	2.26GHz	2.4GHz	3.06GHz
OS	Scientific Linux 5	Scientific Linux 5	Scientific Linux 5	Scientific Linux 6	Scientific Linux 6
interconnect	Infiniband DDR	ethernet	ethernet	Infiniband 2x QDR	Infiniband 2x QDR
topology	full non blocking	-	-	full non blocking	full non blocking
power	85 kW	20 kW	45 kW	27 kW	10 kW
comments	blades	blades	IDPX (water cooled)		ScaleMP

HPC-UGent infrastructure: **Tier2** (STEVIN)

raichu

- 3rd batch cluster
- Ethernet network, shared storage via NFS
- latest Intel processor architecture
- almost same hardware as Tier1 (except for interconnect/memory)

	gengar	*gastly*	*haunter*	*gulpin*	*dugtrio*	*raichu*
vendor	IBM (Intel)	IBM (Intel)	IBM (Intel)	Dell (AMD)	Dell (Intel)	**HP (Intel)**
year	2009	2009	2010	2011	2011	**2012**

HPC-UGent infrastructure: **Tier2** (STEVIN)

delcatty

- featuring IB network & dedicated scratch storage
- intended for multi-node MPI jobs, **default cluster**
- replacement for deprecated gengar cluster
- almost same hardware as Tier1 (different vendor)

	gengar	*gastly*	*haunter*	*gulpin*	*dugtrio*	*raichu*	*delcatty*
vendor	IBM (Intel)	IBM (Intel)	IBM (Intel)	Dell (AMD)	Dell (Intel)	HP (Intel)	**Dell (Intel)**
year	2009	2009	2010	2011	2011	2012	**2013**

VSC infrastructure: **Tier1**

first Tier1 system in Flanders, hosted at UGent

*€4,2M - HP - 528 nodes - 8,448 cores - **152.3 TFlops***

Infiniband FDR - 450TB scratch - 223 kW peak

Top500**: #118 (June 2012), #163 (Nov 2012), #239 (June 2013), **#306 (Nov 2013)

nicknamed *muk*

Picking a cluster

```
module swap cluster/NAME
```

'batch' clusters

gastly

haunter

raichu

- no fast interconnection network
- no shared scratch attached, only local disk
- intended for **single-core** and **single-node** jobs
- use `$VSC_SCRATCH_NODE`, `$TMPDIR` (or `$VSC_SCRATCH_CLUSTER`)

MPI clusters

gulpin

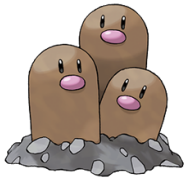
delcatty

(deprecated)

gengar

- fast Infiniband interconnect
- dedicated shared scratch storage (fast)
- intended for **multi-node** MPI jobs
- use `$VSC_SCRATCH_CLUSTER` or `$VSC_SCRATCH_<NAME>`

Special-purpose



dugtrio

- intended for single-node jobs
- large(r) amount of cores/memory available

Tier1

muk

- usage is not free
- access is project-based

Getting a VSC account

Every **UGent employee** is eligible for an HPC account.

Master students can get an account for research purposes (Master thesis, lab sessions, ...), after we receive a brief motivation from their promotor (a ZAP member).

Accounts are **anonymous**, unique and ***personal***:

```
vsc4wxyz
```

Requesting an account is done via

https://account.vscentrum.be/req/

and requires uploading a **public key**.

```
ssh-keygen -t rsa -b 2048
```

public key = your lock, private key = key to your lock

Keep your private key to yourself!

Logging in

Accessing STEVIN is via an **SSH connection** to login nodes:

```
ssh vsc40000@gengar.ugent.be
```

Windows: using PuTTY, Mac OS X: using Terminal.app

Authentication is done using **public/private key pair**

use a password to protect your private key!

Login nodes are named *gligar0[1-3]*:

```
$ hostname
gligar02.gligar.os
```

Submitting and managing jobs

Simulations, experiments, ... are written as **job scripts**.

Submit job scripts to a cluster for execution using `qsub`:

```
$ module swap cluster/raichu
$ qsub job.sh -l walltime=4:00:00 -l nodes=1:ppn=all
123456789.master13.raichu.gent.vsc
```

An **overview** of the active jobs is available via `qstat`:

```
$ qstat
Job id            Name    User        Time Use S Queue
----------------- ------ ---------- -------- - -----
47496.master13    job1    vsc40000   1045:39: R special
47497.master13    job2    vsc40000   1050:58: R special
```

To **remove** a job that is no longer necessary, use `qdel`:

```
$ qdel 123456789
```

Think before you act!

Scheduling policy

The **scheduler** decides which job will start next.

All our clusters use a **fair-share scheduling** policy.

No guarantees on when job will start, so **plan ahead**!

Job **priority** is determined by:

- **historical usage**
  - aim is to balance usage over users
  - infrequent users get higher priority
  - (recent) frequent users get lower priority
- **requested resources** (# nodes/cores, walltime, memory, ...)
  - high resource demand => lower priority
- **time waiting** in queue
  - queued jobs get higher priority over time
- **user limits**
  - avoid that a single user fills up an entire cluster

Working with modules

All user-end software is made available via **modules**.

Modules prepare the environment for using the software.

Module **naming scheme**:

```
<name>/<version>-<toolchain>-<suffix>
```

Load a module to use the software:

```
module load Python/2.7.3-ictce-4.0.6
```

See **currently loaded** modules using `module list`.

Only mix modules built with the **same compiler toolchain**.

e.g., ictce (Intel compilers, Intel MPI, Intel MKL (BLAS, LAPACK))

Get overview of **available** modules using `module avail`.

Load modules in job scripts, ***not*** in your `.bashrc` !

HPC-UGent user wiki

Documentation is available at the user wiki:

http://hpc.ugent.be/userwiki

- getting an account
- writing job scripts
- submitting and managing jobs
- working with array jobs
- overview of available software
- tips and tricks
- software-specific documentation (user-editable!)
- creating/joining a virtual organization (VO)
- ...

Mailing lists

You are automatically subscribed to two mailing lists:

hpc-announce@lists.ugent.be:

- announcements w.r.t. maintenance, downtime, ...
- training courses: SWPC, “Getting Started with HPC”, ...
- HPC-UGent newsletter
- subscription remains while your VSC account is active

hpc-users@lists.ugent.be:

- important announcements for active users
- unexpected problems with the infrastructure
- Q&A by users, e.g., software-specific problems
- unsubscribing is possible (but not recommended)

Contacting HPC-UGent support

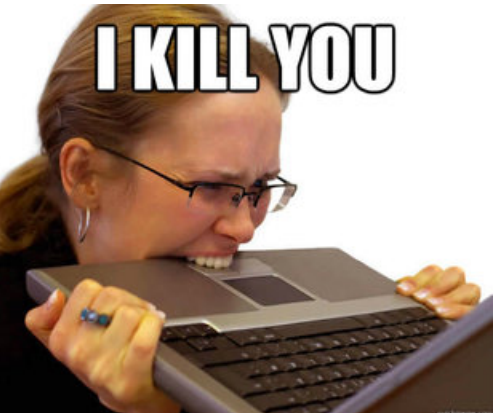
Easiest way to contact HPC team for **support** is via e-mail.

Direct submission into HPC queue of UGent helpdesk:

hpc@ugent.be

Always include:

- clear description of problem (or question)
- location of job script and output/error files in your account
- job IDs, which cluster
- VSC login id
- use your UGent email address, preferably



Alternatives:

- short meeting (for complex problems, big projects)
- hpc-users mailing list (depends on the problem)

Software installation requests

Request for new **software** installations: *hpc@ugent.be*

Always include:

- software name and website
- location to download source files
  - or make install files available in your account
- build instructions (if you have them)
- a simple test case with expected output
  - including instructions on how to run it

Requests may take a while to process,

especially for new software packages.

So make the request sooner rather than later.

EasyBuild: *http://hpcugent.github.io/easybuild/*

Publications

Acknowledge HPC-UGent in your (relevant) publications!

The computational resources (STEVIN Supercomputer Infrastructure) and services used in this work were kindly provided by Ghent University, the Flemish Supercomputer Center (VSC), the Hercules Foundation and the Flemish Government – department EWI.

Very important for funding and motivating new purchases!

Specify **HPC-UGent** (case-sensitive) as a project for your publications when registering them at

https://biblio.ugent.be

Full list of registered publications available on our website:

https://biblio.ugent.be/project/HPC-UGent

Writing good job scripts: PBS directives

Include reasonable PBS directives in your job script:

```
#!/bin/bash
#PBS -N solving_42  ## job name
#PBS -q short  ## short queue (less than 12h)
#PBS -l nodes=1:ppn=all  ## single-node job
#PBS -l walltime=10:00:00  ## max. 10h of walltime
#PBS -l vmem=4gb  ## max. 4GB virtual memory
```

Settings can be overridden on the `qsub` command line:

```
qsub job.sh -l walltime=20:00:00 -q long
```

Writing good job scripts: environment

Use the available environment variables:

- **`$PBS_O_WORKDIR`**
  directory in which job was submitted
  e.g., use `cd $PBS_O_WORKDIR` on top
- **`$PBS_JOBID`**
  job id of running job
- **`$PBS_ARRAYID`**
  array id of running job
  only relevant when submitting array jobs (`qsub -t`)
- **`$EBROOTFOO`**, **`$EBVERSIONFOO`**
  root directory/version for software package Foo,
  only available when module is loaded
- different filesystems: **`$VSC_HOME`**, **`$VSC_DATA`**, **`$VSC_SCRATCH`**, **`$VSC_SCRATCH_NODE`**, **`$TMPDIR`**

Writing good job scripts: filesystems

Use the different filesystems for what they are intended.

- **home** (`$VSC_HOME`):
  - slow access, low volume (max. 3GB)
  - intended for a limited number of small files (e.g., scripts)
- **data** (`$VSC_DATA, $VSC_DATA_VO`):
  - intended for 'long-term' storage of common data
  - slow access (especially non-streaming)
  - for large volumes of data
- **scratch** (`$VSC_SCRATCH`, `$VSC_SCRATCH_VO`, ...):
  - intended working directory for (multi-node) jobs
  - beware on NFS-mounted clusters! (gastly, haunter, raichu, ...)
- **local disk** (`$VSC_SCRATCH_NODE`, `$TMPDIR`):
  - working directory for single-node jobs
  - should be preferred on NFS clusters, if volume permits
  - `$TMPDIR`: unique directory on local disk (e.g., `/local/$PBS_JOBID`)

NO BACKUPS!!!

see also ***http://hpc.ugent.be/userwiki/index.php/User:StorageDetails***

Writing good job scripts: track useful info

Make it easy on yourself: keep track of useful info.

Typical (recommended) job script:

```
$ cat job.sh
#!/bin/bash
#PBS -l nodes=1:ppn=all
#PBS -l walltime=10:00:00

module load Python/2.7.3-ictce-4.0.6
echo -n "date: "; date
echo "job id: $PBS_JOBID"
echo -n "workernode: "; hostname
cd $TMPDIR
echo "working dir: "; pwd
echo "loaded modules:"
module list

cp $VSC_DATA/input.data .
cp $PBS_O_WORKDIR/experiment.py .
python experiment.py &> my.log
cp my.log $VSC_SCRATCH/my.log.$PBS_JOBID
```

Building your software for HPC-UGent

Important attention point when building your own software:

- build software **on the cluster** itself, not on your laptop or login nodes
- always compile **for the cluster** you're going to run on
  - use a job script, or an interactive job (`qsub -I ...`)
  - Intel compilers: `icc -O2 -xHOST`, GCC: `gcc -O2 -march=native`
    - important for *optimal performance* (e.g., AVX instructions on raichu)
  - pro tip: use `$VSC_INSTITUTE_CLUSTER` for cluster-specific binaries
- use **compiler toolchain modules**, e.g. `ictce`, `gimkl`, `goolf`:
  - `ictce`: Intel compilers and libraries (**recommended!**)
    `ictce/3.x`: Intel v11, `ictce/4.x`: Intel v12, `ictce/5.x`: Intel v13
  - `gimkl`: GCC compilers + Intel MPI, Intel MKL
  - `goolf`: GCC, OpenMPI, OpenBLAS, LAPACK, FFTW, ...
- **don't mix and match** compiler toolchains!

Investing in central HPC infrastructure

UNIVERSITEIT GENT

VSC Vlaams Supercomputer Centrum

HPC UGENT

HPC-UGent users

stichting van openbaar nut
HERCULES STICHTING

Met steun van de Vlaamse overheid

Investing in central HPC infrastructure

User contributions - return on investment?

Fairshare target increase

- Fairshare = priority ≠ allocation of compute time
- Depends on historical resource usage, job requests
- Target increase:

default	= ~2,7 % for all default users
VO	= ~2,7 % for all VO members
X0000 €	≈ + Y%

- 3-year valid, 1-year degressive, relative value ≠ constant

Pilot usage
