# Introduction

## WALDUR

Waldur is an open-source (MIT) cloud management platform with a marketplace. Used as a self-service platform by organizations for internal and external users.

While generic in design, main accent has been on private clouds and HPC systems.

Mature, ~10 years, developed mostly by OpenNode OÜ and University of Tartu.

# Main goals

- User onboarding
- Team and project management
- Reporting
- Service offering management
- Resource management
- Helpdesk integration

The image displays several screenshots of the WALDUR cloud management interface. The top-left screenshot shows the main dashboard with a sidebar menu containing 'Organizations', 'Projects', 'Resources', 'Reporting', 'Calls', 'Marketplace', 'Support', and 'Administration'. The top-right screenshot shows a 'Basic offering' page with a map and 'Deploy', 'Preview order form', and 'Reload' buttons. The middle-left screenshot shows a 'Usage history' bar chart for 'Storage', 'RAM', and 'Cores' from May 2023 to April 2024. The middle-right screenshot shows a 'Usage' tab with a table of resource metrics. The bottom-right screenshot shows a 'Latest offerings' grid with cards for 'LEMP in OpenStack', 'Meluxina HPC Cluster', and 'Tutorial 4: Using Grafana'.

# Design principles

## Open and flexible

Cultural choice. Crucial for collaboration. Non-viral licensing. Configurable, feature toggles, extension points.

## User friendly

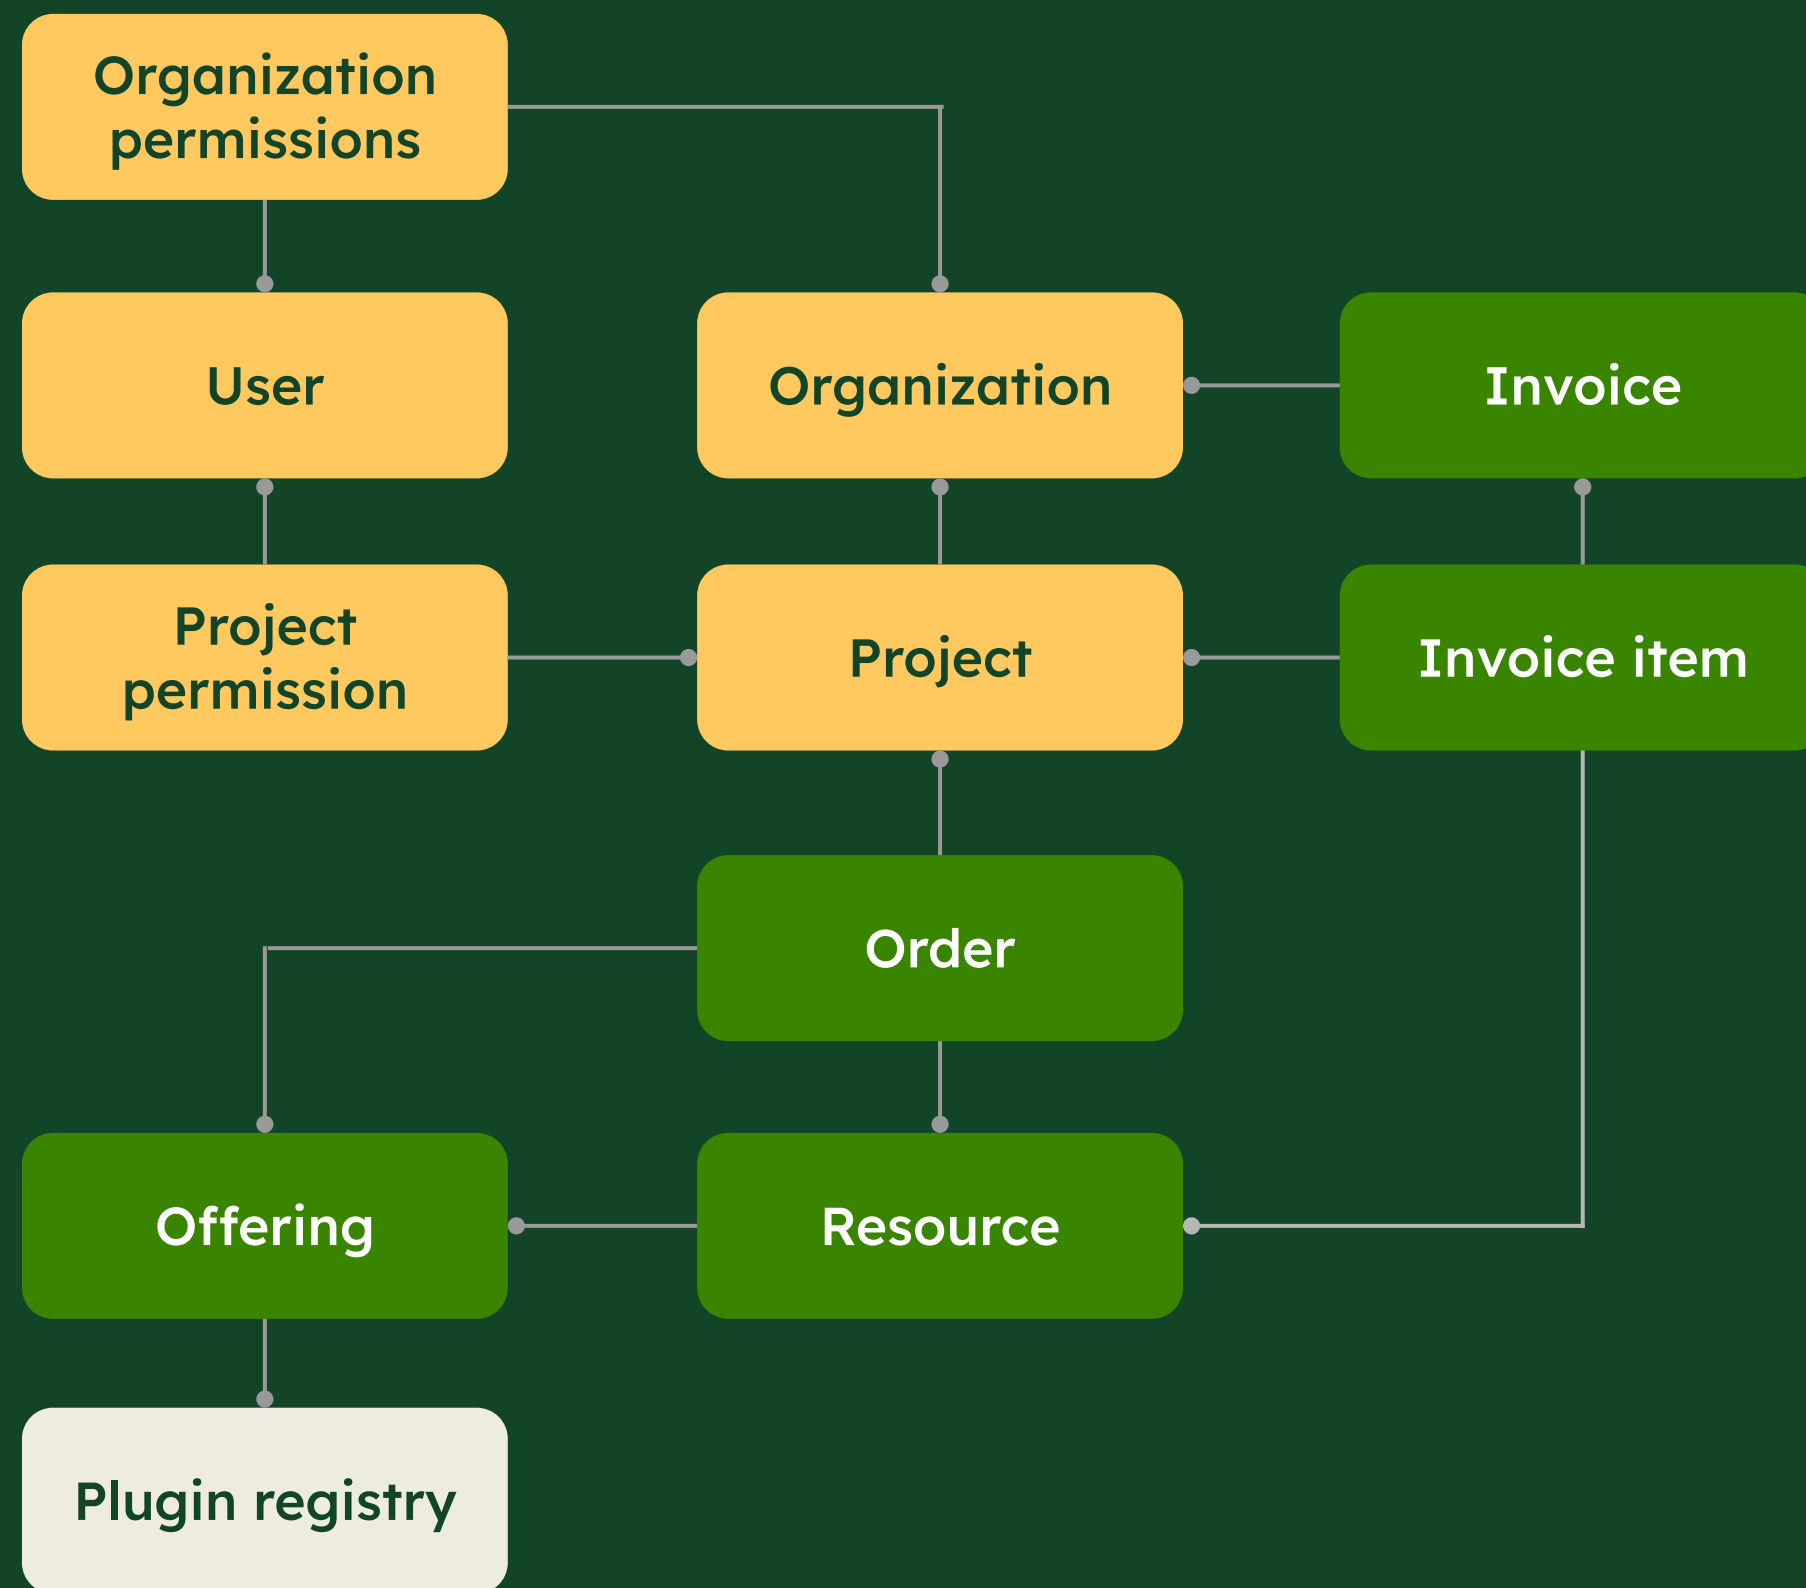

Happy end-users = happy operators. API-first with web-based GUI. SDKs and configuration management modules.

## Secure

Stable technologies, security in development and operations.

# Multi-tenancy and cost tracking

# Architecture of Waldur

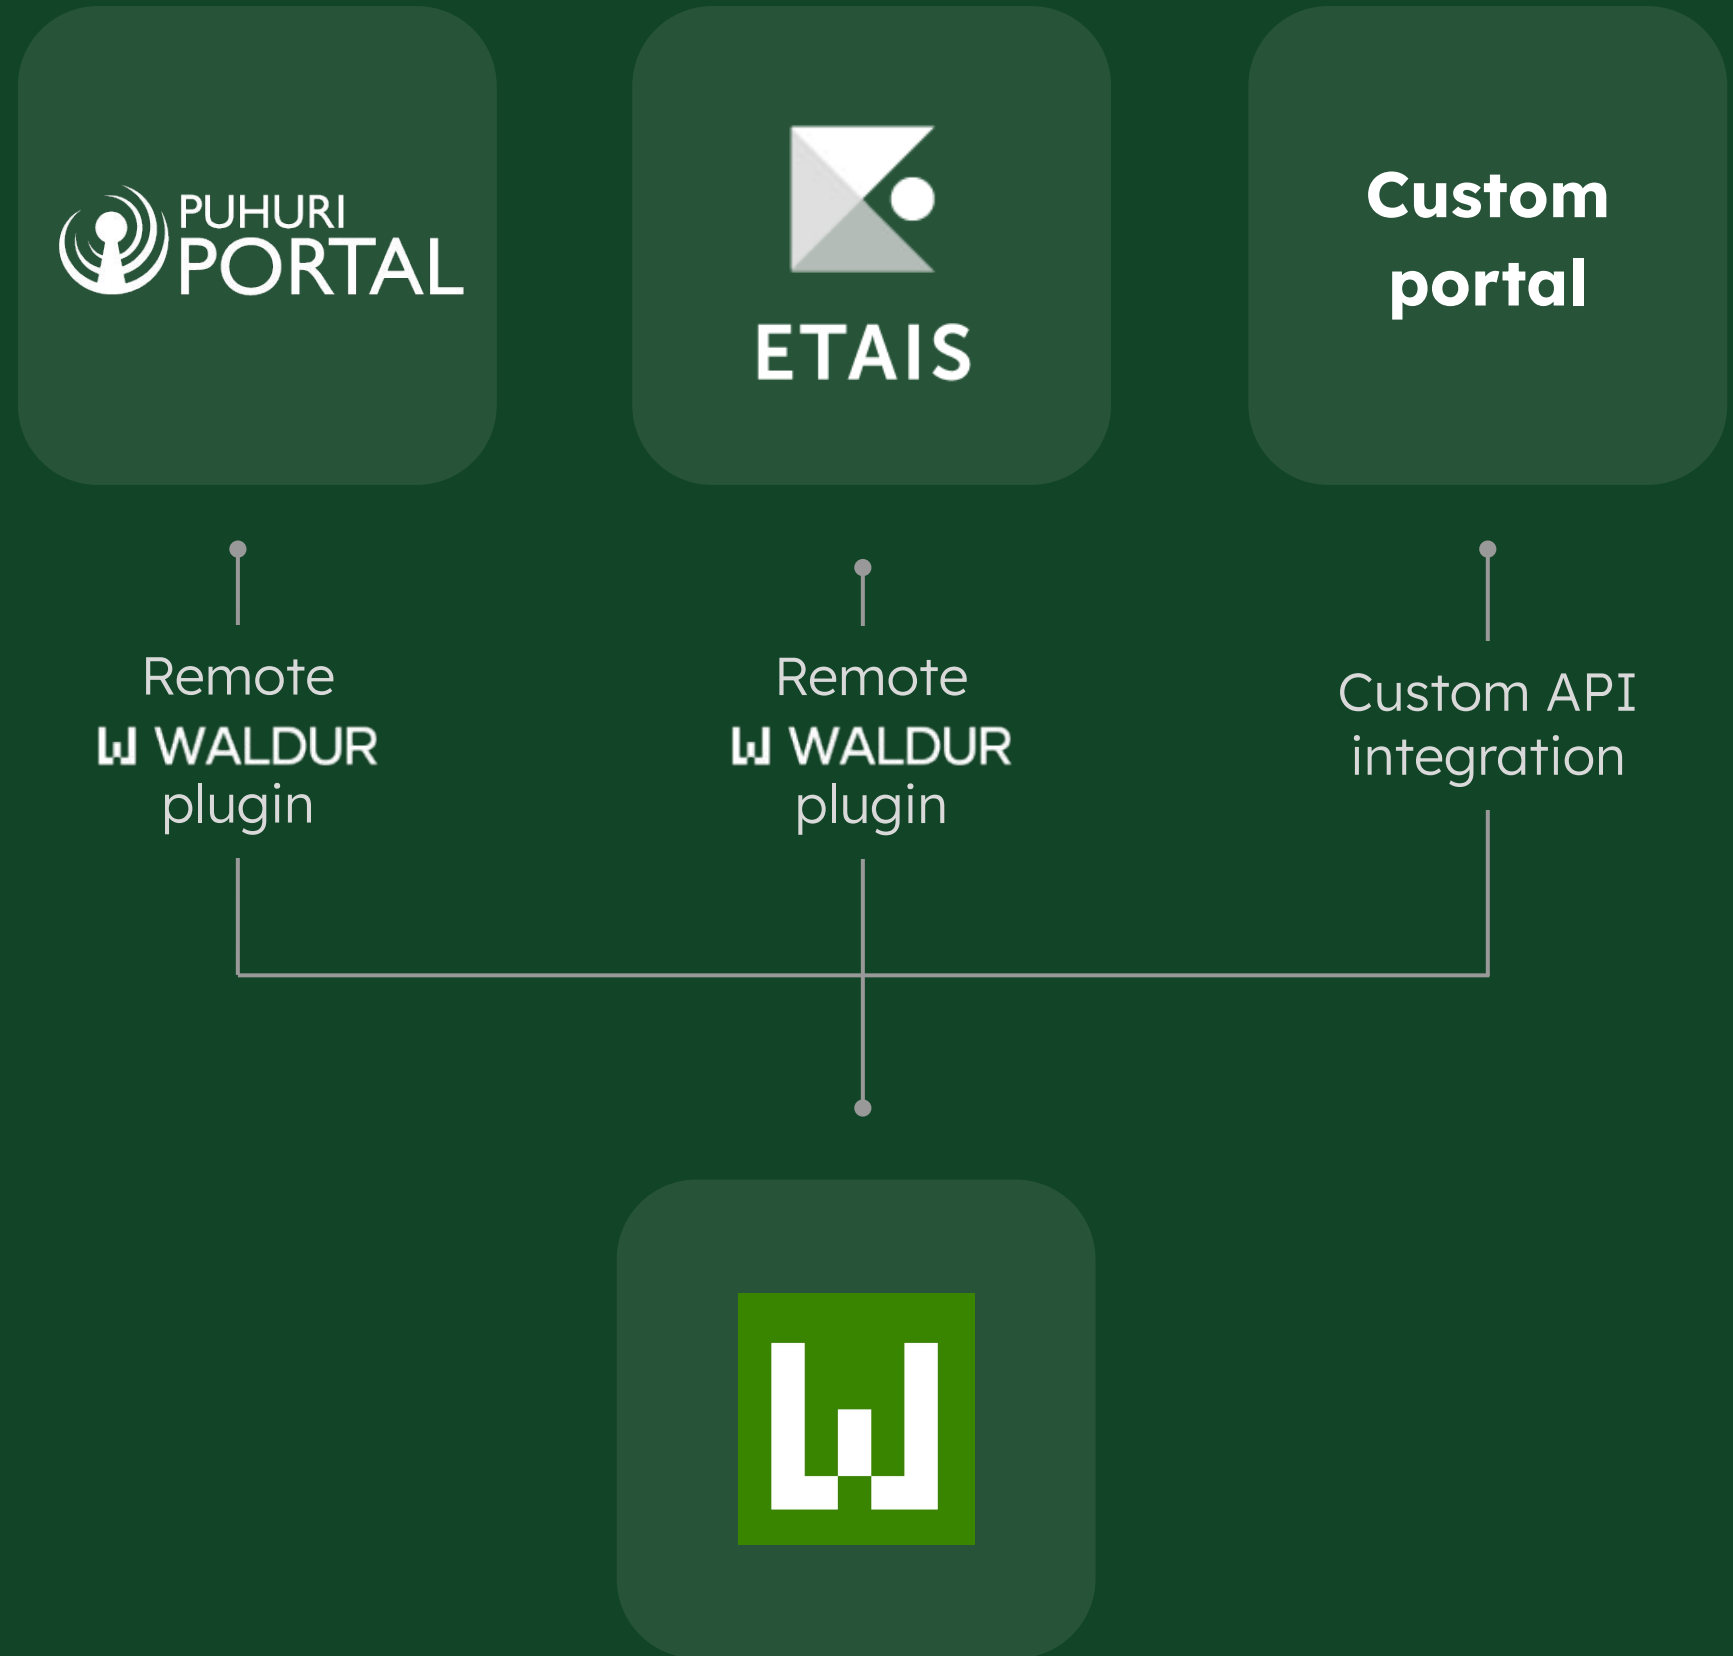

# Using Waldur to Consolidate Access

# Using Waldur to Share Access

# Observability

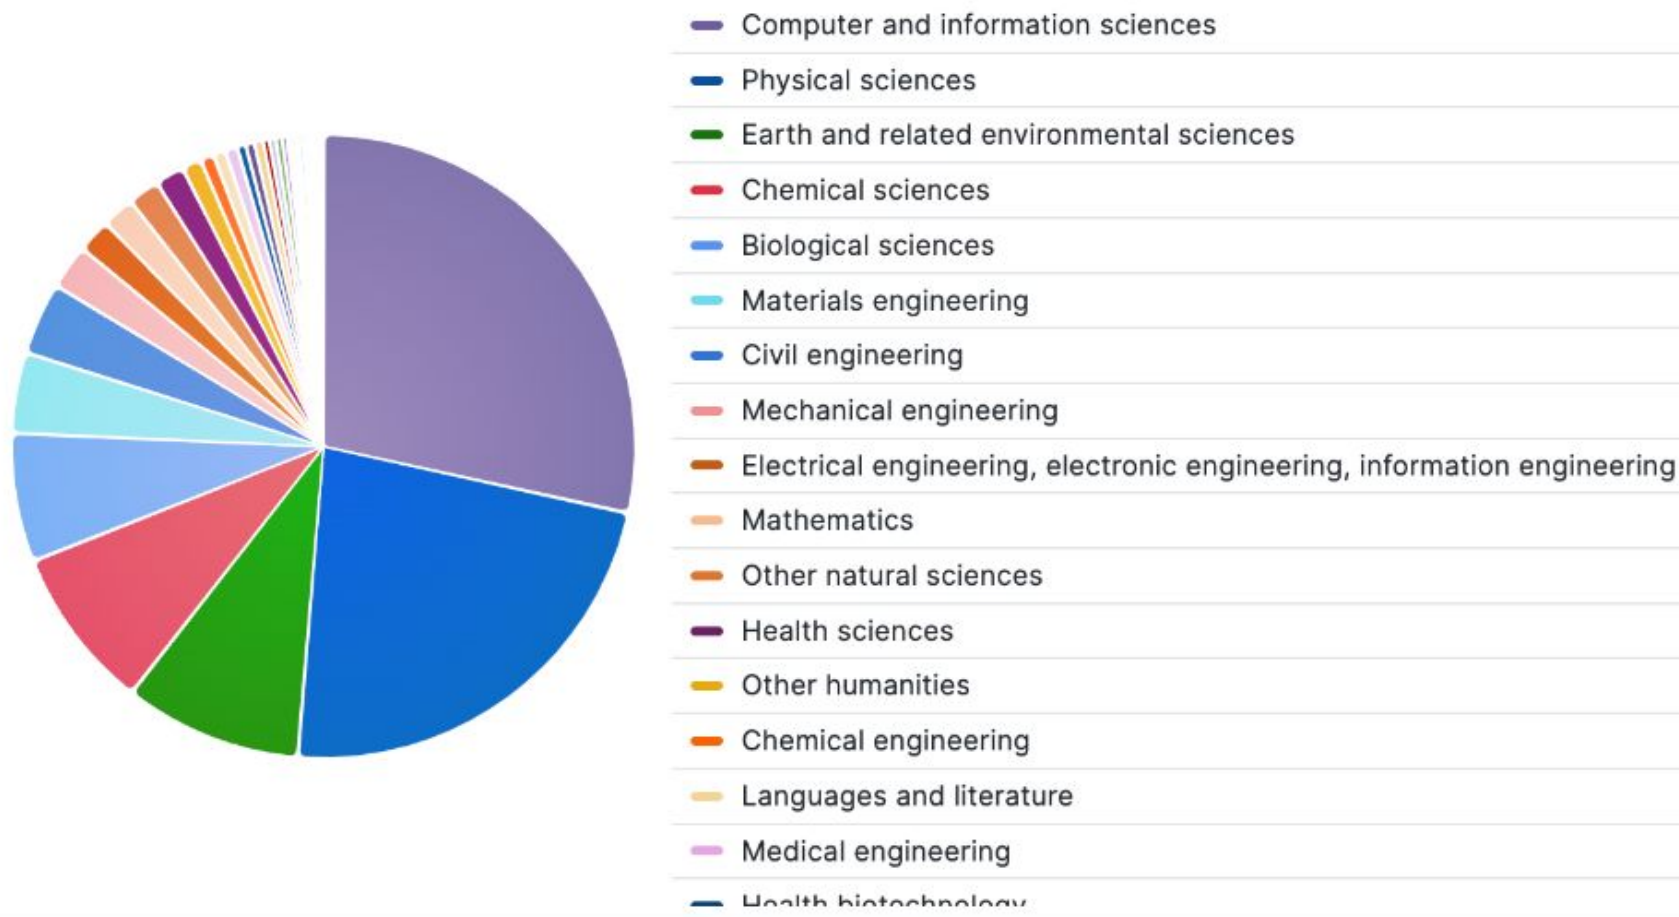

Waldur DB / Prometheus exporters can be used for building custom dashboards.

There are several mechanisms in Waldur to support collection of customised information about resources / projects for easy reporting.

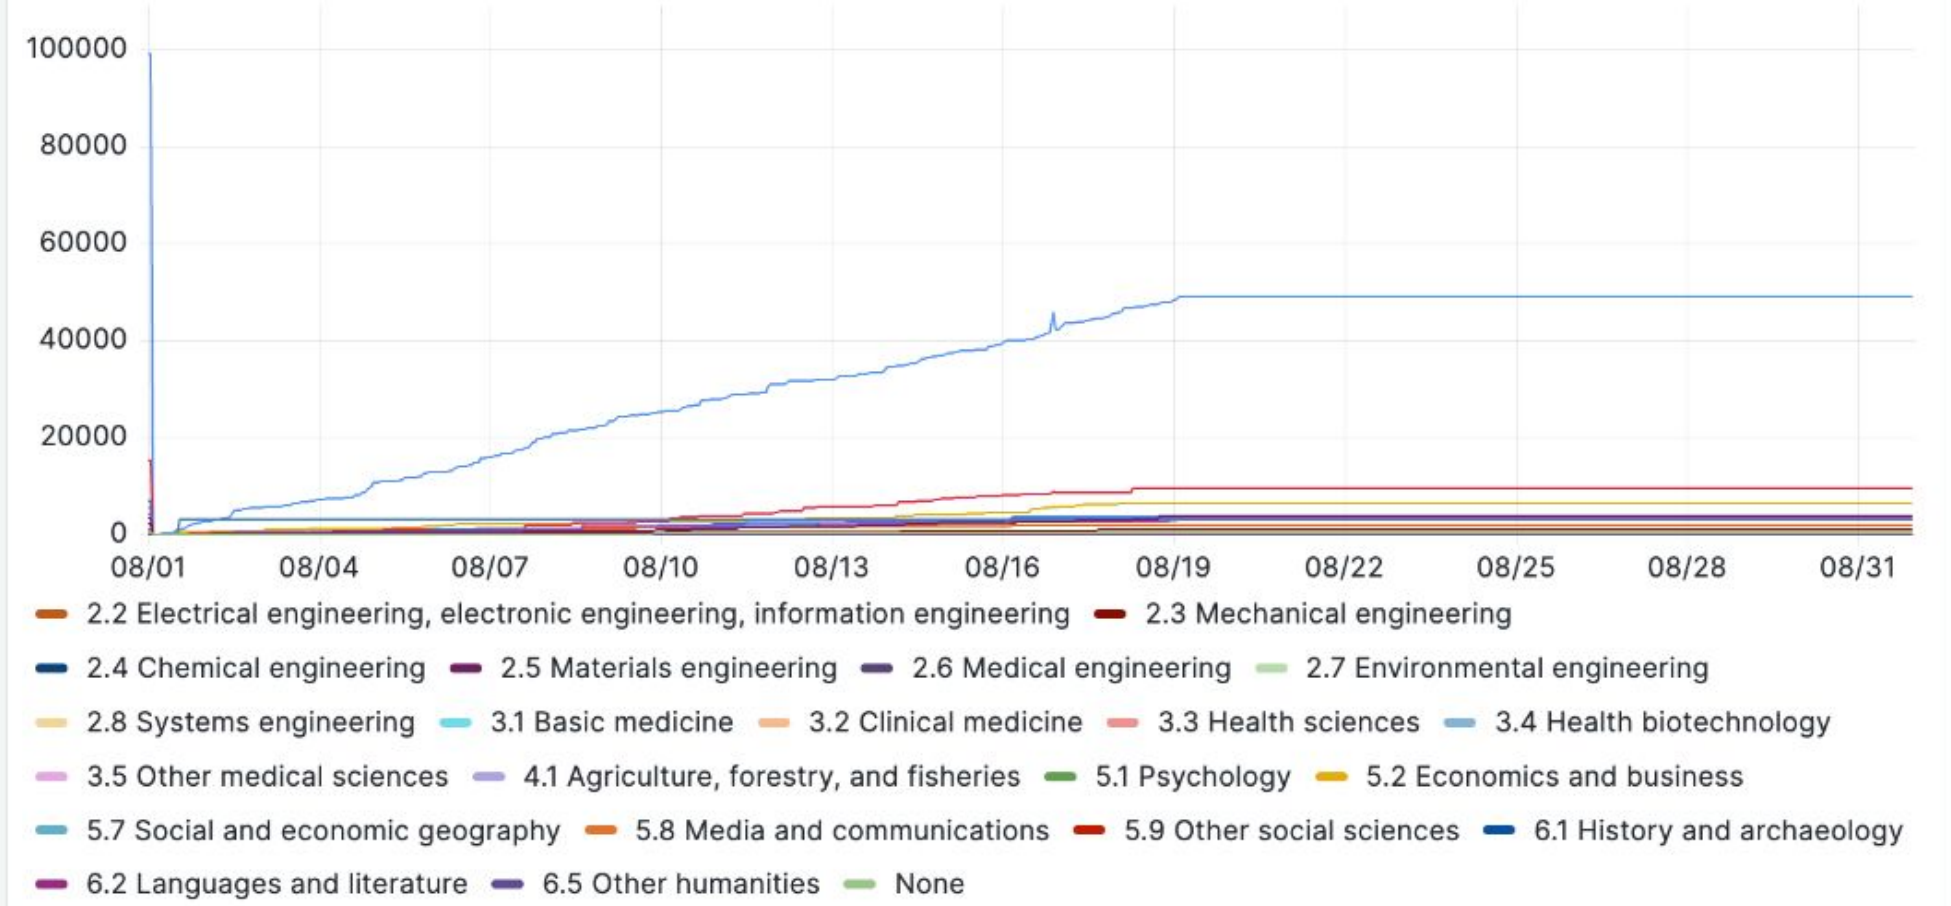

OECD science code and industry code classification

Projects per OECD code

CPU k-hour usage by OECD science code

Storage TB-hour usage by OECD science code

GPU hour usage by OECD science code

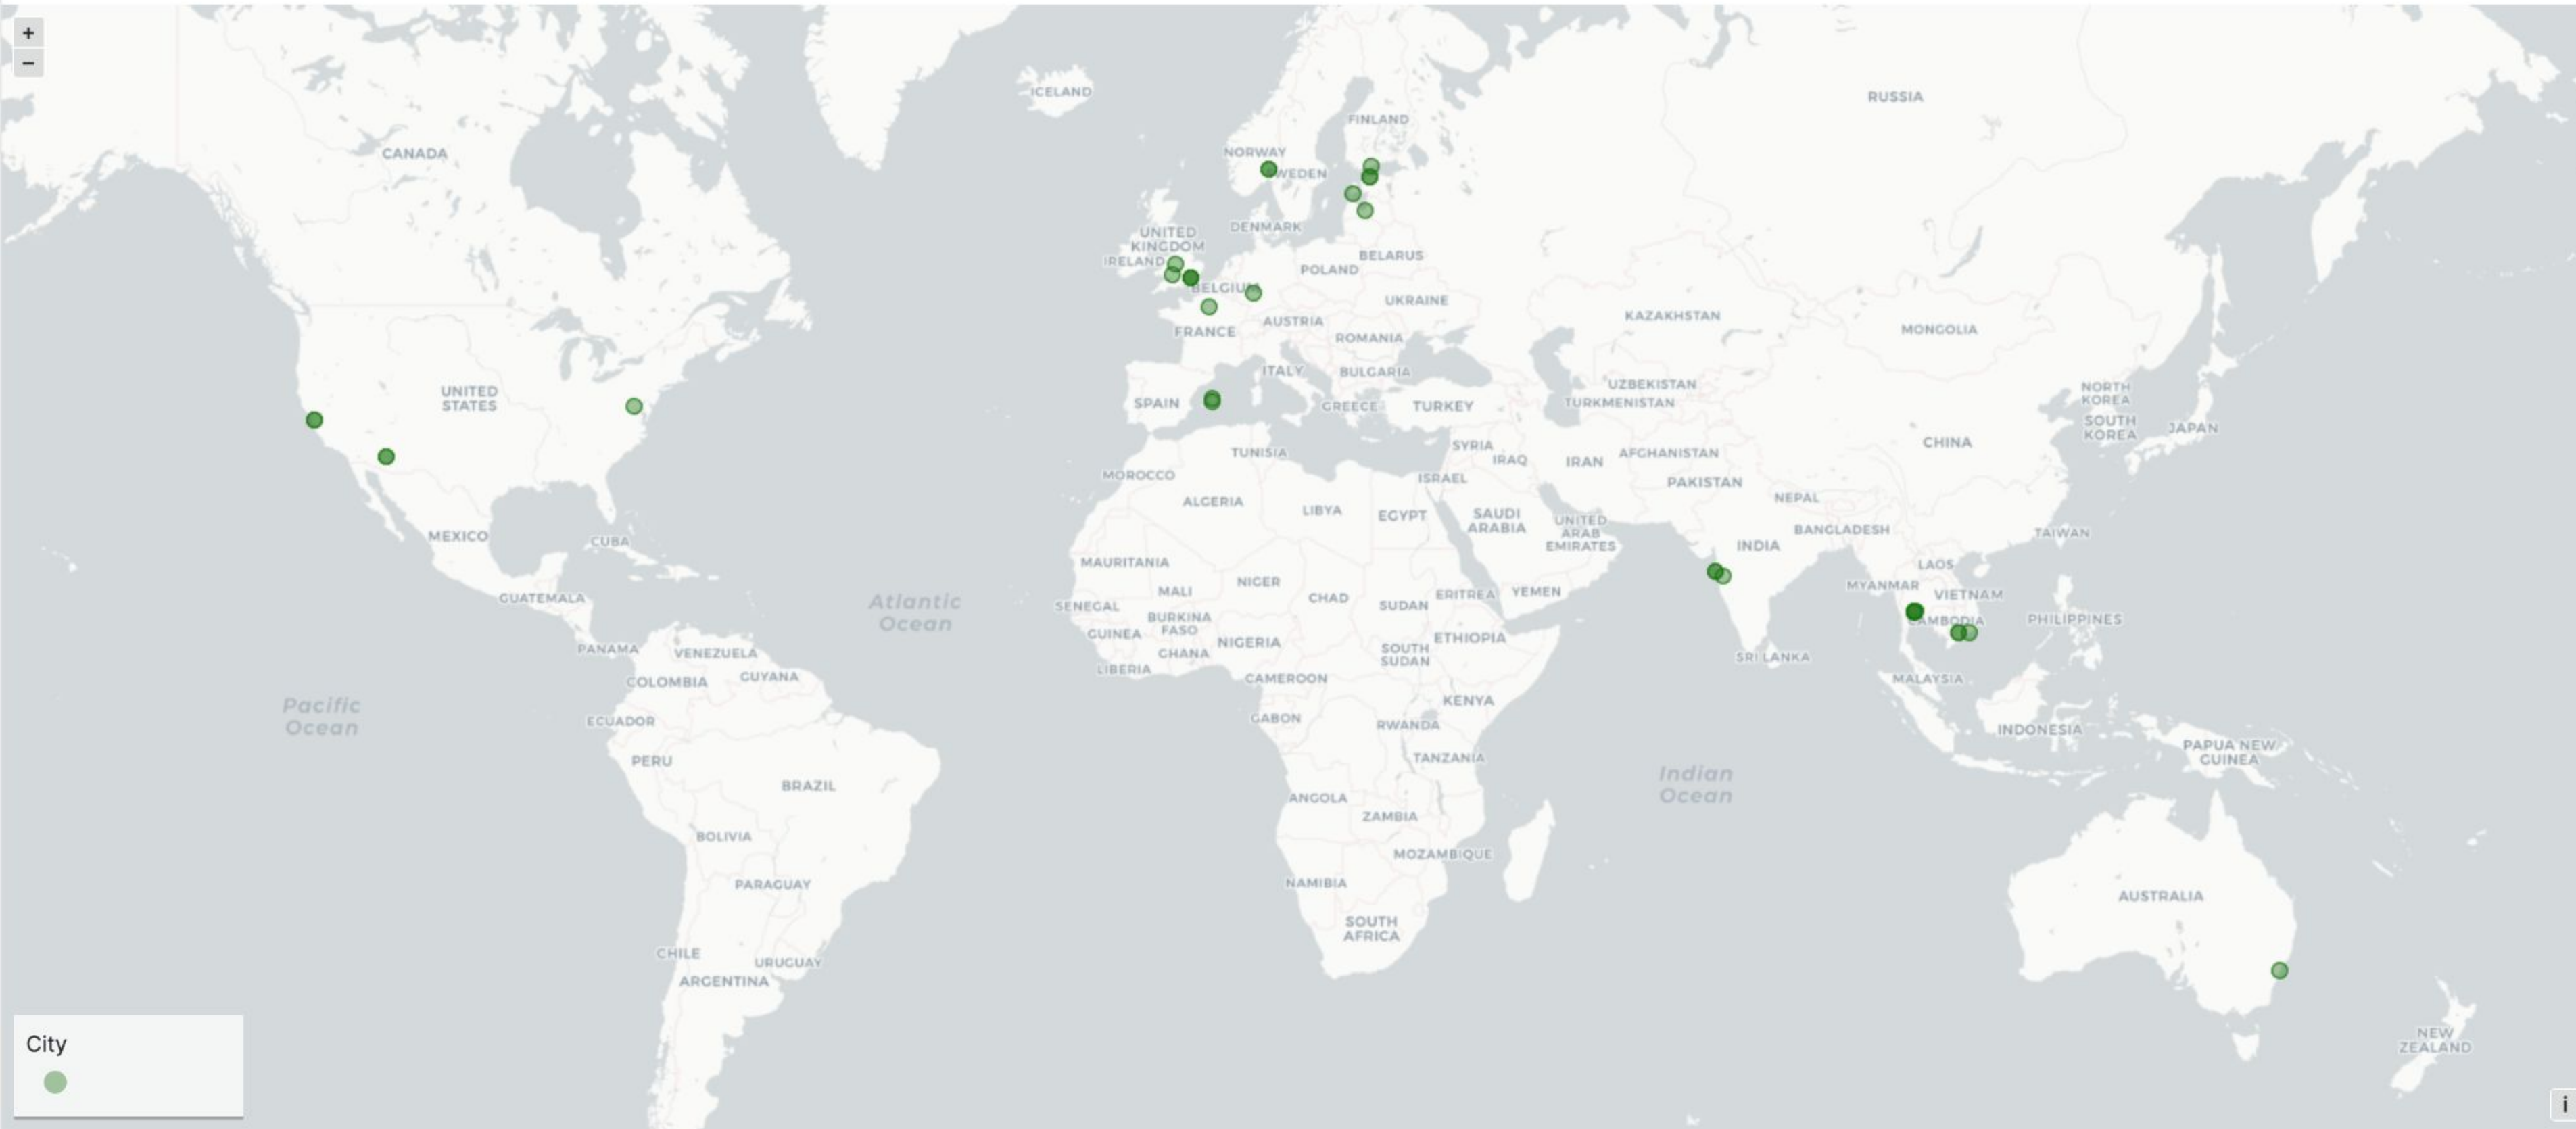

# Used by

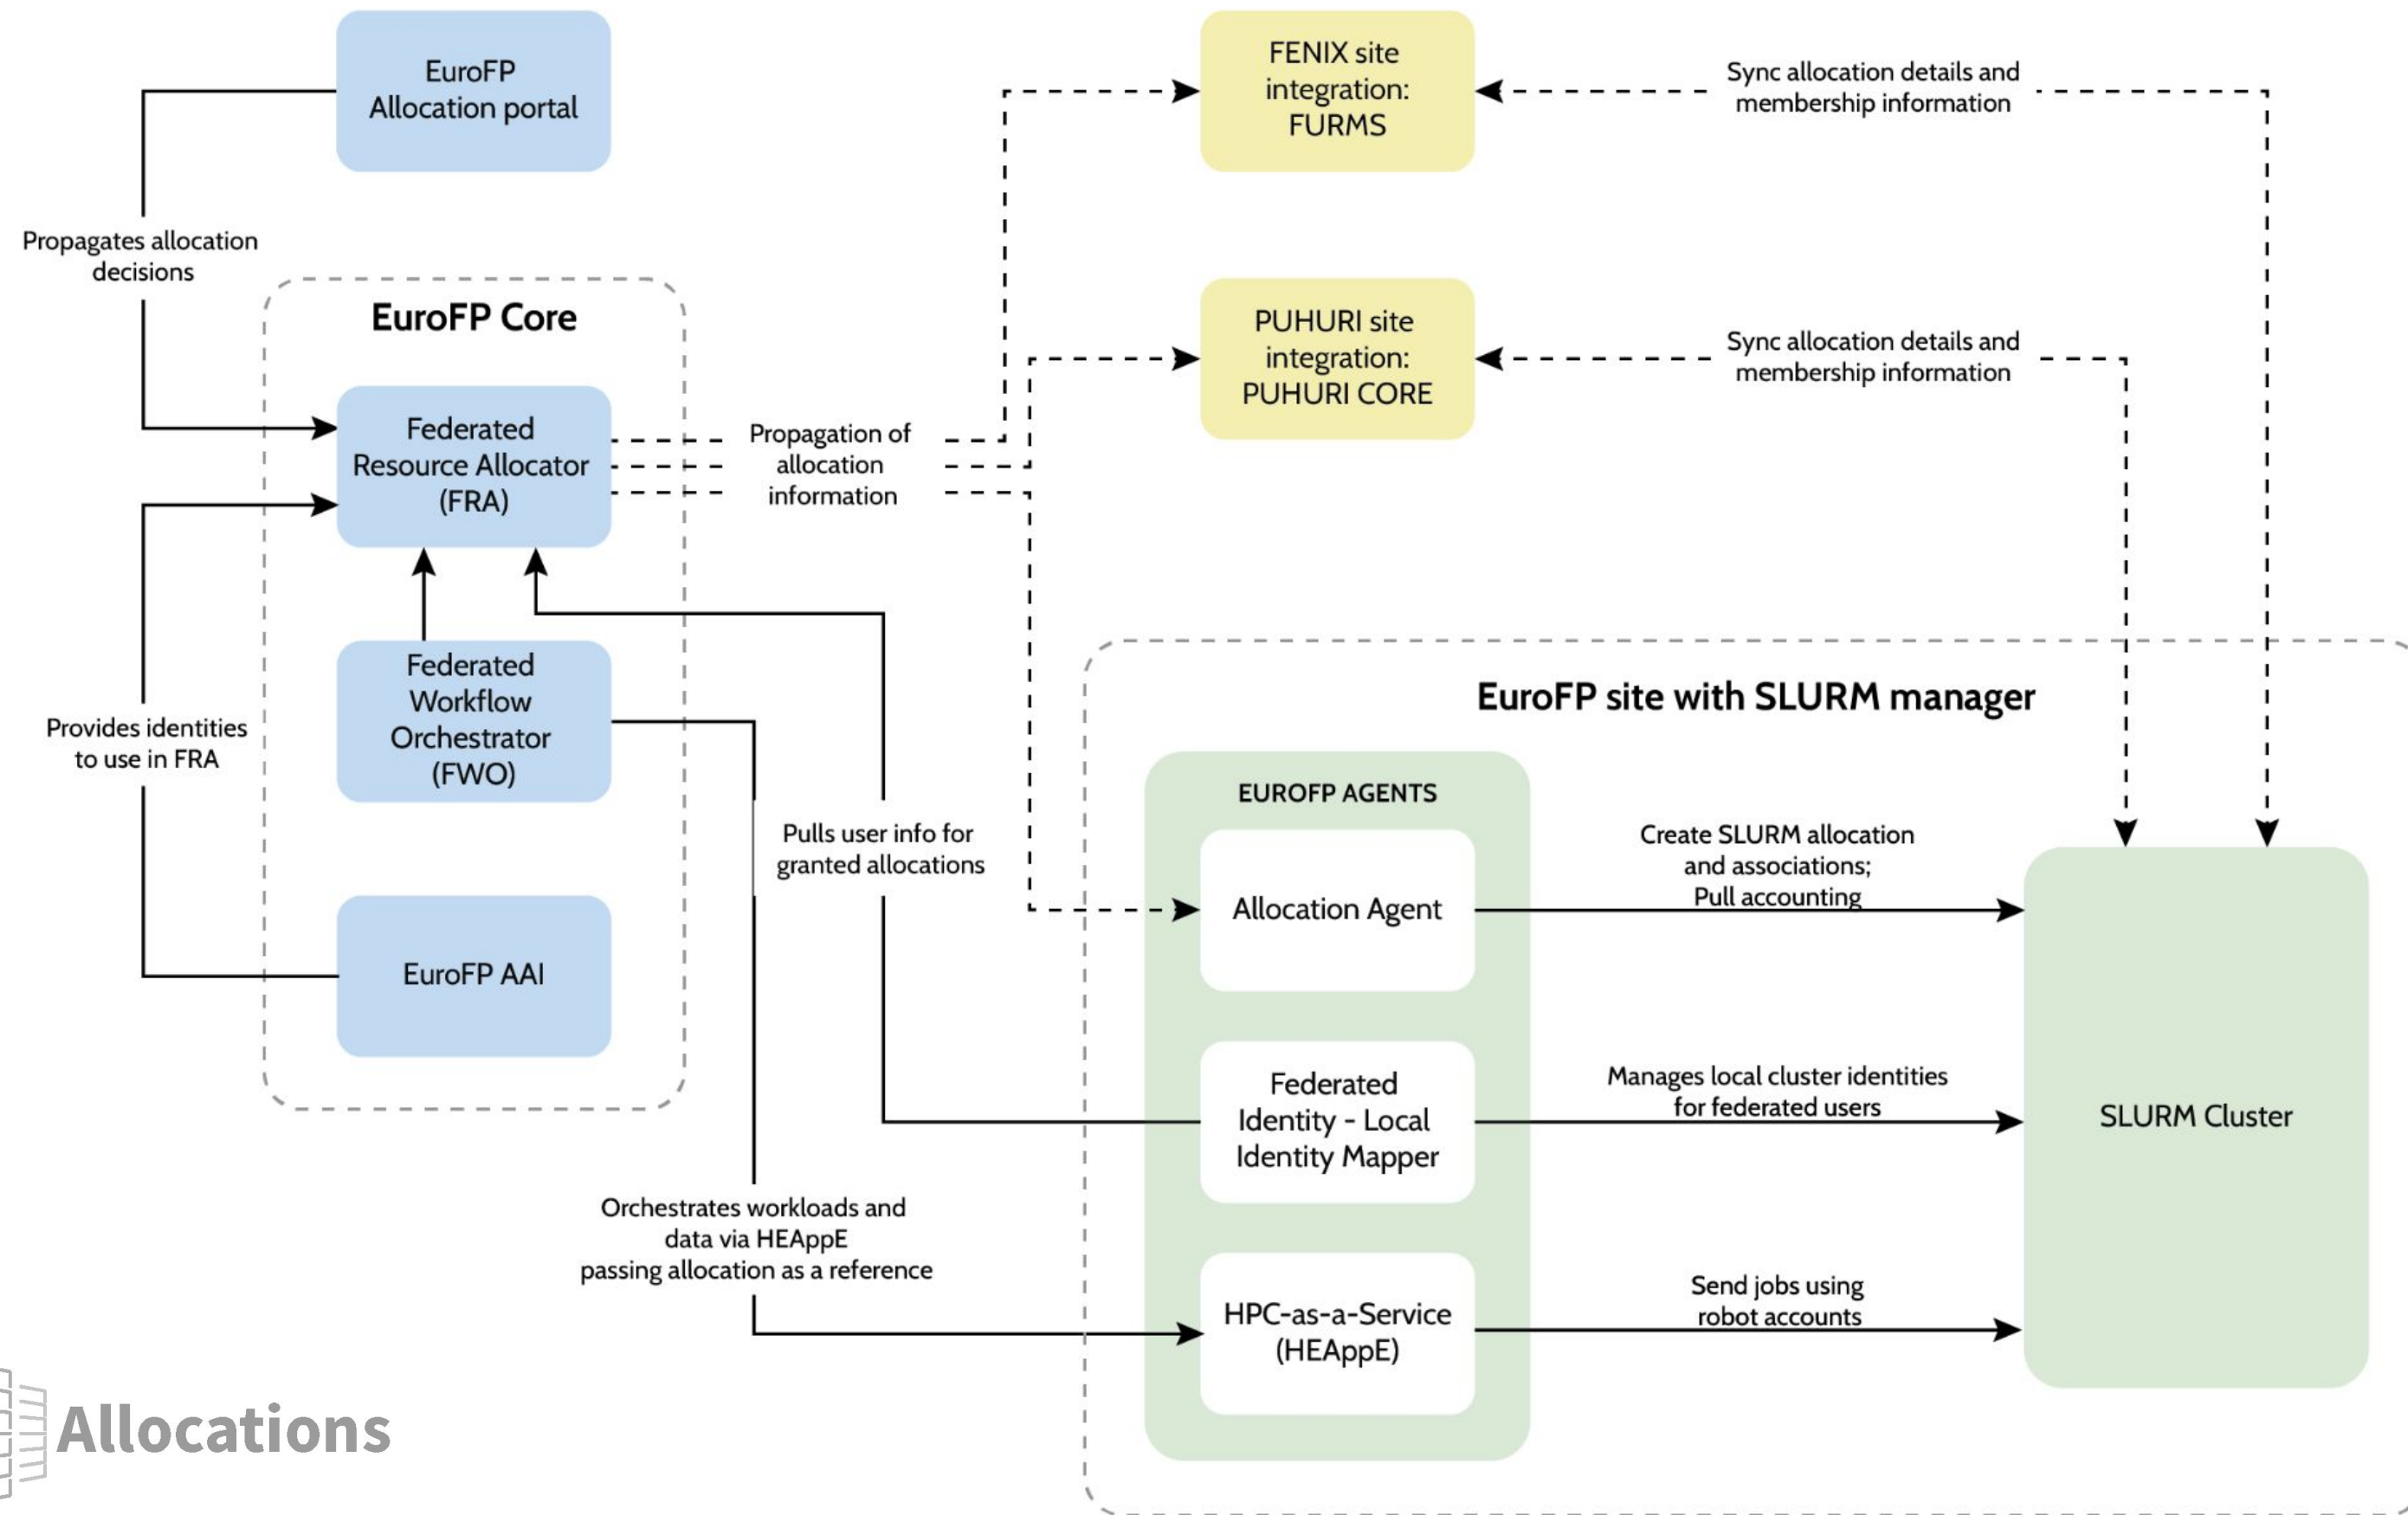

Waldur known locations

City

Draft plan of integration of HE sites with EFP for allocation management

# Aggregation of service catalogues into a common gateway

A NeIC funded project for building a service for cross-border resource allocation. Main user: EuroHPC LUMI

# Zero-trust architecture

Several access interfaces to HPC infrastructure could be integrated behind a common IAM with Waldur providing user group / access management.

Example with OOD, SLURM and Firecrest.

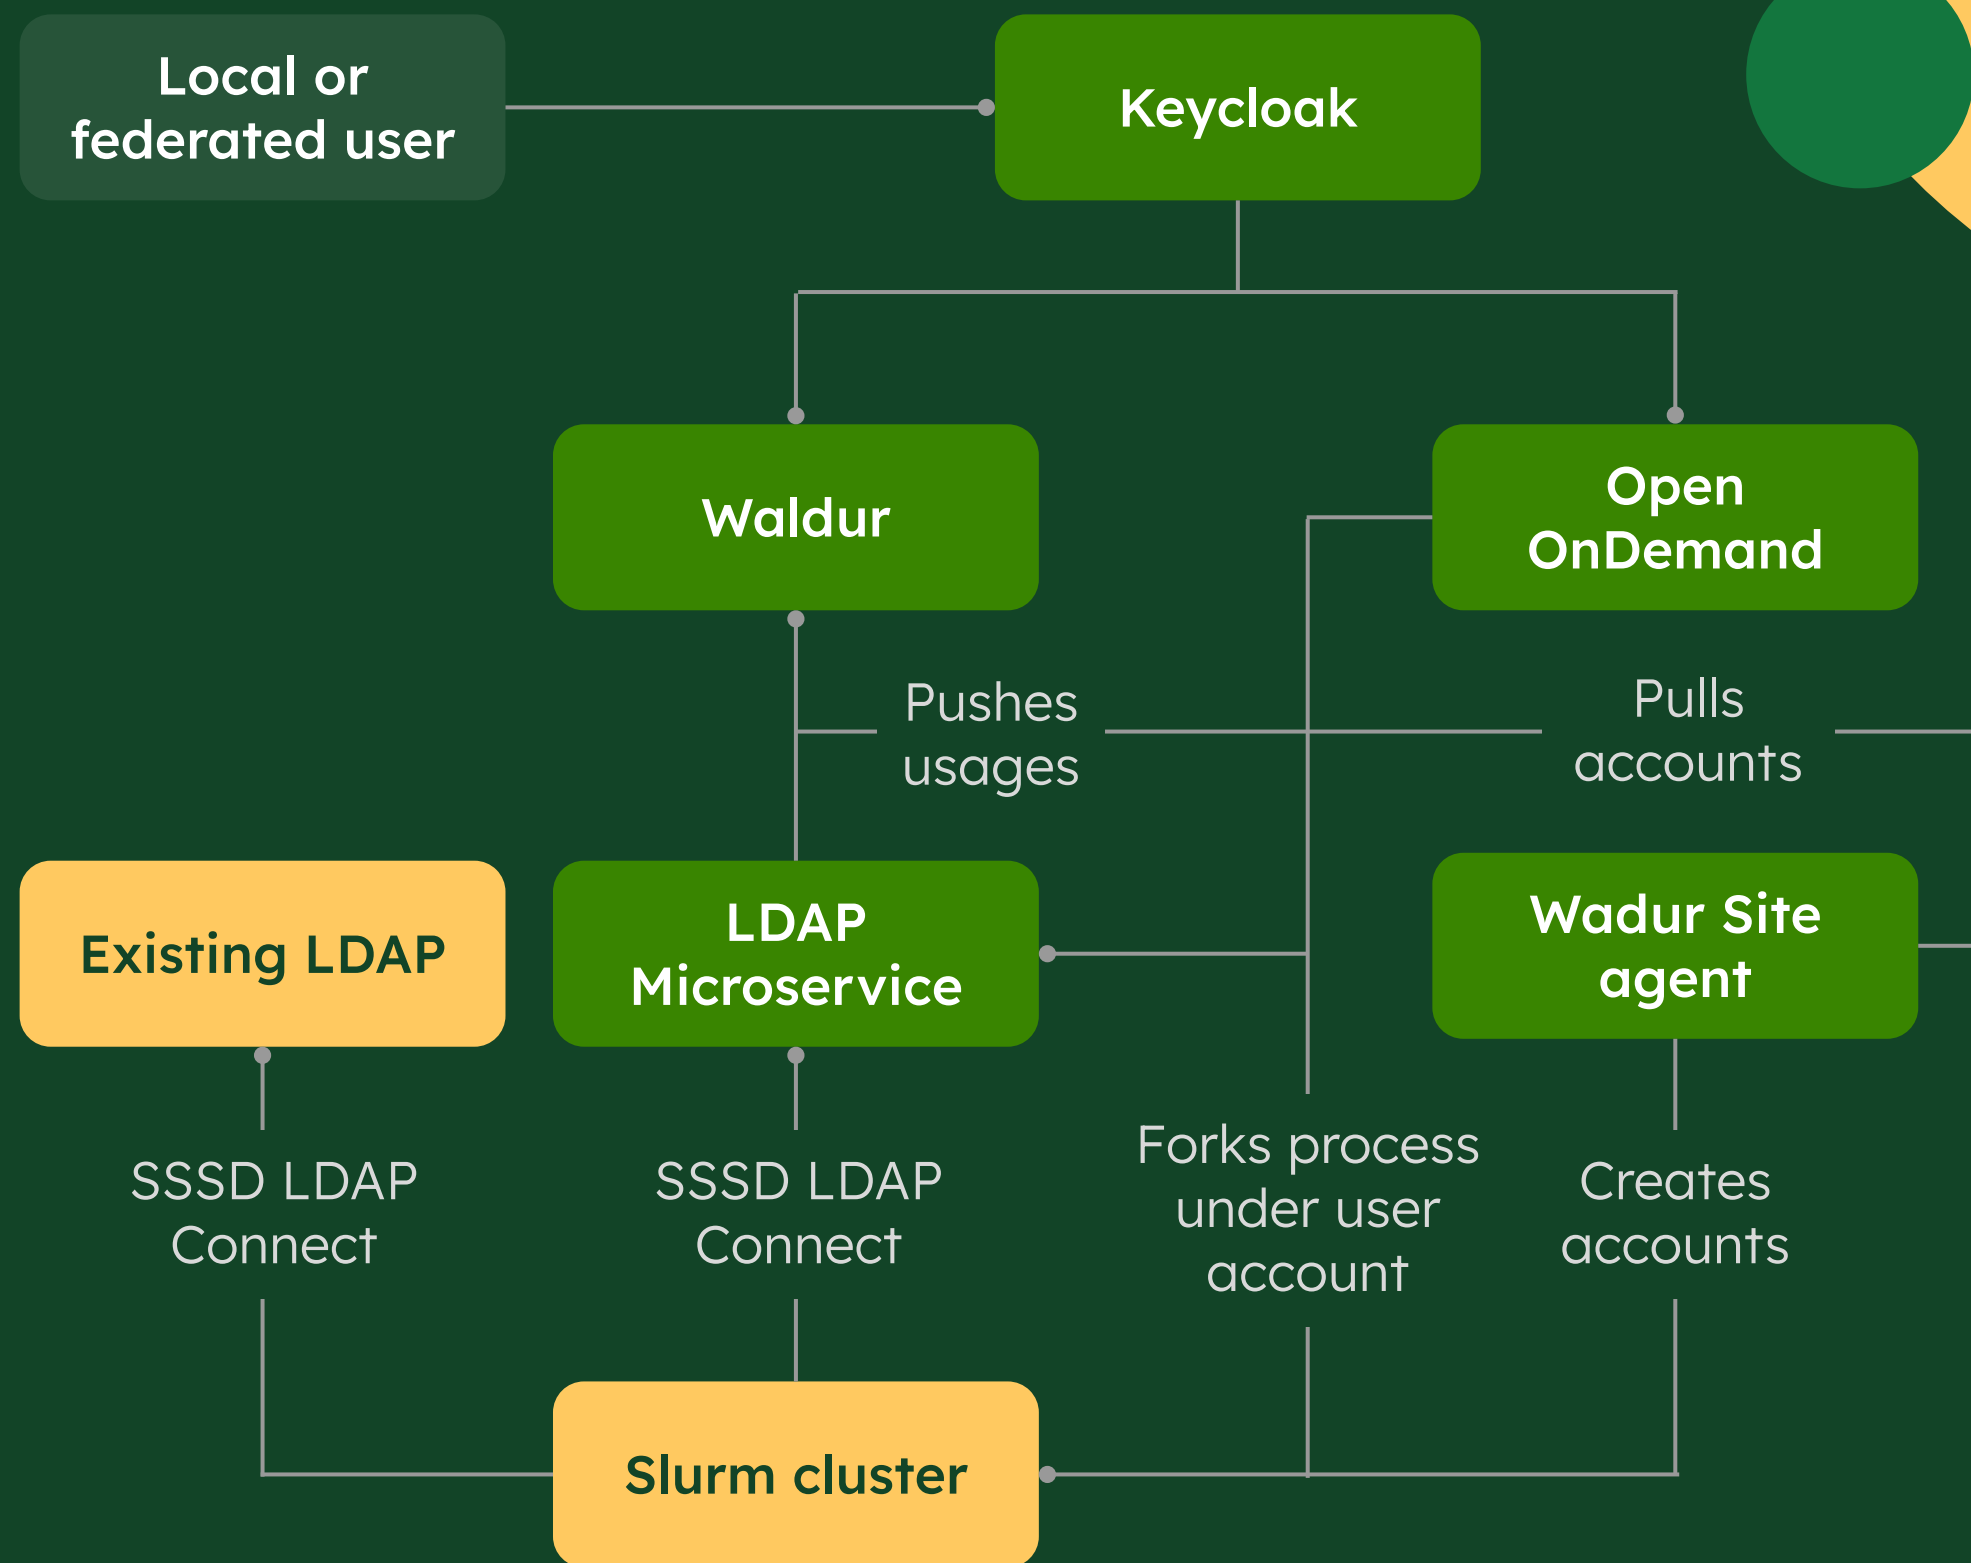

# Example: Open OnDemand integration

Open OnDemand (OOD) is a web interface for HPC clusters

- Home directory access
- Job submission
- Interactive jobs
- Web console

Relies on Linux usernames and OIDC authentication

# OOD + FirecREST + MyAccessID

Several access interfaces to HPC infrastructure could be integrated behind a common IAM with Waldur providing user group / access management
